NAG Library Function Document

nag_dormtr (f08fgc)

1 Purpose

nag_dormtr (f08fgc) multiplies an arbitrary real matrix C by the real orthogonal matrix Q which was determined by nag_dsytrd (f08fec) when reducing a real symmetric matrix to tridiagonal form.

2 Specification

```
#include <nag.h>
#include <nagf08.h>
void nag_dormtr (Nag_OrderType order, Nag_SideType side, Nag_UploType uplo,
     Nag_TransType trans, Integer m, Integer n, const double a[],
     Integer pda, const double tau[], double c[], Integer pdc,
     NagError *fail)
```

3 Description

nag_dormtr (f08fgc) is intended to be used after a call to nag_dsytrd (f08fec), which reduces a real symmetric matrix A to symmetric tridiagonal form T by an orthogonal similarity transformation: $A = QTQ^{\mathrm{T}}$. nag_dsytrd (f08fec) represents the orthogonal matrix Q as a product of elementary reflectors.

This function may be used to form one of the matrix products

$$QC, Q^{\mathrm{T}}C, CQ \text{ or } CQ^{\mathrm{T}},$$

overwriting the result on C (which may be any real rectangular matrix).

A common application of this function is to transform a matrix Z of eigenvectors of T to the matrix QZ of eigenvectors of A.

5 Arguments

1: **order** – Nag_OrderType *Input*

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 2.3.1.3 in How to Use the NAG Library and its Documentation for a more detailed explanation of the use of this argument.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

2: **side** – Nag_SideType *Input*

On entry: indicates how Q or Q^{T} is to be applied to C.

side = Nag_LeftSide
Q or Q^{T} is applied to C from the left.

side = Nag_RightSide
Q or Q^{T} is applied to C from the right.

Constraint: **side** = Nag_LeftSide or Nag_RightSide.

3: **uplo** – Nag_UploType *Input*

On entry: this **must** be the same argument **uplo** as supplied to nag_dsytrd (f08fec).

Constraint: **uplo** = Nag_Upper or Nag_Lower.

4: **trans** – Nag_TransType *Input*

On entry: indicates whether Q or Q^{T} is to be applied to C.

trans = Nag_NoTrans
Q is applied to C.

trans = Nag_Trans
Q^{T} is applied to C.

Constraint: **trans** = Nag_NoTrans or Nag_Trans.

5: **m** – Integer *Input*

On entry: m, the number of rows of the matrix C; m is also the order of Q if **side** = Nag_LeftSide.

Constraint: $\mathbf{m} \geq 0$.

6: **n** – Integer *Input*

On entry: n, the number of columns of the matrix C; n is also the order of Q if **side** = Nag_RightSide.

Constraint: $\mathbf{n} \geq 0$.

7: **a**[dim] – const double *Input*

Note: the dimension, *dim*, of the array **a** must be at least

$\max(1, \mathbf{pda} \times \mathbf{m})$ when **side** = Nag_LeftSide;
$\max(1, \mathbf{pda} \times \mathbf{n})$ when **side** = Nag_RightSide.

On entry: details of the vectors which define the elementary reflectors, as returned by nag_dsytrd (f08fec).

8: **pda** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) of the matrix A in the array **a**.

Constraints:

if **side** = Nag_LeftSide, $\mathbf{pda} \geq \max(1, \mathbf{m})$;
if **side** = Nag_RightSide, $\mathbf{pda} \geq \max(1, \mathbf{n})$.

9: **tau**[dim] – const double *Input*

Note: the dimension, *dim*, of the array **tau** must be at least

$\max(1, \mathbf{m} - 1)$ when **side** = Nag_LeftSide;
$\max(1, \mathbf{n} - 1)$ when **side** = Nag_RightSide.

On entry: further details of the elementary reflectors, as returned by nag_dsytrd (f08fec).

10: **c**[*dim*] – double *Input/Output*

Note: the dimension, *dim*, of the array **c** must be at least

$\max(1, \mathbf{pdc} \times \mathbf{n})$ when **order** = Nag_ColMajor;
$\max(1, \mathbf{m} \times \mathbf{pdc})$ when **order** = Nag_RowMajor.

The (i, j)th element of the matrix C is stored in

$\mathbf{c}[(j-1) \times \mathbf{pdc} + i - 1]$ when **order** = Nag_ColMajor;
$\mathbf{c}[(i-1) \times \mathbf{pdc} + j - 1]$ when **order** = Nag_RowMajor.

On entry: the m by n matrix C.

On exit: **c** is overwritten by QC or $Q^{\mathrm{T}}C$ or CQ or CQ^{T} as specified by **side** and **trans**.

11: **pdc** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) in the array **c**.

Constraints:

if **order** = Nag_ColMajor, **pdc** $\geq \max(1, \mathbf{m})$;
if **order** = Nag_RowMajor, **pdc** $\geq \max(1, \mathbf{n})$.

12: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.
See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

NE_BAD_PARAM

On entry, argument ⟨*value*⟩ had an illegal value.

NE_ENUM_INT_3

On entry, **side** = ⟨*value*⟩, **m** = ⟨*value*⟩, **n** = ⟨*value*⟩ and **pda** = ⟨*value*⟩.
Constraint: if **side** = Nag_LeftSide, **pda** $\geq \max(1, \mathbf{m})$;
if **side** = Nag_RightSide, **pda** $\geq \max(1, \mathbf{n})$.

NE_INT

On entry, **m** = ⟨*value*⟩.
Constraint: **m** ≥ 0.

On entry, **n** = ⟨*value*⟩.
Constraint: **n** ≥ 0.

On entry, **pda** = ⟨*value*⟩.
Constraint: **pda** > 0.

On entry, **pdc** = ⟨*value*⟩.
Constraint: **pdc** > 0.

NE_INT_2

On entry, **pdc** = ⟨*value*⟩ and **m** = ⟨*value*⟩.
Constraint: **pdc** $\geq \max(1, \mathbf{m})$.

On entry, **pdc** $= \langle value \rangle$ and **n** $= \langle value \rangle$.
Constraint: **pdc** $\geq \max(1, \mathbf{n})$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.
See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

7 Accuracy

The computed result differs from the exact result by a matrix E such that

$$\|E\|_2 = O(\epsilon)\|C\|_2,$$

where ϵ is the ***machine precision***.

8 Parallelism and Performance

nag_dormtr (f08fgc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag_dormtr (f08fgc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of floating-point operations is approximately $2m^2n$ if **side** $=$ Nag_LeftSide and $2mn^2$ if **side** $=$ Nag_RightSide.

The complex analogue of this function is nag_zunmtr (f08fuc).

10 Example

This example computes the two smallest eigenvalues, and the associated eigenvectors, of the matrix A, where

$$A = \begin{pmatrix} 2.07 & 3.87 & 4.20 & -1.15 \\ 3.87 & -0.21 & 1.87 & 0.63 \\ 4.20 & 1.87 & 1.15 & 2.06 \\ -1.15 & 0.63 & 2.06 & -1.81 \end{pmatrix}.$$

Here A is symmetric and must first be reduced to tridiagonal form T by nag_dsytrd (f08fec). The program then calls nag_dstebz (f08jjc) to compute the requested eigenvalues and nag_dstein (f08jkc) to compute the associated eigenvectors of T. Finally nag_dormtr (f08fgc) is called to transform the eigenvectors to those of A.
