NAG Library Function Document

nag_zhseqr (f08psc)

1 Purpose

nag_zhseqr (f08psc) computes all the eigenvalues and, optionally, the Schur factorization of a complex Hessenberg matrix or a complex general matrix which has been reduced to Hessenberg form.

2 Specification

```
#include <nag.h>
#include <nagf08.h>
void nag_zhseqr (Nag_OrderType order, Nag_JobType job,
     Nag_ComputeZType compz, Integer n, Integer ilo, Integer ihi,
     Complex h[], Integer pdh, Complex w[], Complex z[], Integer pdz,
     NagError *fail)
```

3 Description

nag_zhseqr (f08psc) computes all the eigenvalues and, optionally, the Schur factorization of a complex upper Hessenberg matrix H:

$$H = ZTZ^{\mathrm{H}},$$

where T is an upper triangular matrix (the Schur form of H), and Z is the unitary matrix whose columns are the Schur vectors z_i. The diagonal elements of T are the eigenvalues of H.

The function may also be used to compute the Schur factorization of a complex general matrix A which has been reduced to upper Hessenberg form H:

$$\begin{aligned} A &= QHQ^{\mathrm{H}}, \text{ where } Q \text{ is unitary,} \\ &= (QZ)T(QZ)^{\mathrm{H}}. \end{aligned}$$

In this case, after nag_zgehrd (f08nsc) has been called to reduce A to Hessenberg form, nag_zunghr (f08ntc) must be called to form Q explicitly; Q is then passed to nag_zhseqr (f08psc), which must be called with **compz** = Nag_UpdateZ.

The function can also take advantage of a previous call to nag_zgebal (f08nvc) which may have balanced the original matrix before reducing it to Hessenberg form, so that the Hessenberg matrix H has the structure:

$$\begin{pmatrix} H_{11} & H_{12} & H_{13} \\ & H_{22} & H_{23} \\ & & H_{33} \end{pmatrix}$$

where H_{11} and H_{33} are upper triangular. If so, only the central diagonal block H_{22} (in rows and columns i_{lo} to i_{hi}) needs to be further reduced to Schur form (the blocks H_{12} and H_{23} are also affected). Therefore the values of i_{lo} and i_{hi} can be supplied to nag_zhseqr (f08psc) directly. Also, nag_zgebak (f08nwc) must be called after this function to permute the Schur vectors of the balanced matrix to those of the original matrix. If nag_zgebal (f08nvc) has not been called however, then i_{lo} must be set to 1 and i_{hi} to n. Note that if the Schur factorization of A is required, nag_zgebal (f08nvc) must **not** be called with **job** = Nag_Scale or Nag_DoBoth, because the balancing transformation is not unitary.

nag_zhseqr (f08psc) uses a multishift form of the upper Hessenberg QR algorithm, due to Bai and Demmel (1989). The Schur vectors are normalized so that $\|z_i\|_2 = 1$, but are determined only to within a complex factor of absolute value 1.

5 Arguments

1: **order** – Nag_OrderType *Input*

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 2.3.1.3 in How to Use the NAG Library and its Documentation for a more detailed explanation of the use of this argument.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

2: **job** – Nag_JobType *Input*

On entry: indicates whether eigenvalues only or the Schur form T is required.

job = Nag_EigVals
Eigenvalues only are required.

job = Nag_Schur
The Schur form T is required.

Constraint: **job** = Nag_EigVals or Nag_Schur.

3: **compz** – Nag_ComputeZType *Input*

On entry: indicates whether the Schur vectors are to be computed.

compz = Nag_NotZ
No Schur vectors are computed (and the array **z** is not referenced).

compz = Nag_UpdateZ
The Schur vectors of A are computed (and the array **z** must contain the matrix Q on entry).

compz = Nag_InitZ
The Schur vectors of H are computed (and the array **z** is initialized by the function).

Constraint: **compz** = Nag_NotZ, Nag_UpdateZ or Nag_InitZ.

4: **n** – Integer *Input*

On entry: n, the order of the matrix H.

Constraint: $\mathbf{n} \geq 0$.

5: **ilo** – Integer *Input*
6: **ihi** – Integer *Input*

On entry: if the matrix A has been balanced by nag_zgebal (f08nvc), then **ilo** and **ihi** must contain the values returned by that function. Otherwise, **ilo** must be set to 1 and **ihi** to **n**.

Constraint: $\mathbf{ilo} \geq 1$ and $\min(\mathbf{ilo}, \mathbf{n}) \leq \mathbf{ihi} \leq \mathbf{n}$.

7: **h**[dim] – Complex *Input/Output*

Note: the dimension, *dim*, of the array **h** must be at least $\max(1, \mathbf{pdh} \times \mathbf{n})$.

Where $\mathbf{H}(i,j)$ appears in this document, it refers to the array element

$\mathbf{h}[(j-1) \times \mathbf{pdh} + i - 1]$ when **order** = Nag_ColMajor;
$\mathbf{h}[(i-1) \times \mathbf{pdh} + j - 1]$ when **order** = Nag_RowMajor.

On entry: the n by n upper Hessenberg matrix H, as returned by nag_zgehrd (f08nsc).

On exit: if **job** = Nag_EigVals, the array contains no useful information.

If **job** = Nag_Schur, **h** is overwritten by the upper triangular matrix T from the Schur decomposition (the Schur form) unless **fail**.**code** = NE_CONVERGENCE.

8: **pdh** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) in the array **h**.

Constraint: **pdh** $\geq \max(1, \mathbf{n})$.

9: **w**$[dim]$ – Complex *Output*

Note: the dimension, *dim*, of the array **w** must be at least $\max(1, \mathbf{n})$.

On exit: the computed eigenvalues, unless **fail**.**code** = NE_CONVERGENCE (in which case see Section 6). The eigenvalues are stored in the same order as on the diagonal of the Schur form T (if computed).

10: **z**$[dim]$ – Complex *Input/Output*

Note: the dimension, *dim*, of the array **z** must be at least

$\max(1, \mathbf{pdz} \times \mathbf{n})$ when **compz** = Nag_UpdateZ or Nag_InitZ;
1 when **compz** = Nag_NotZ.

The (i,j)th element of the matrix Z is stored in

$\mathbf{z}[(j-1) \times \mathbf{pdz} + i - 1]$ when **order** = Nag_ColMajor;
$\mathbf{z}[(i-1) \times \mathbf{pdz} + j - 1]$ when **order** = Nag_RowMajor.

On entry: if **compz** = Nag_UpdateZ, **z** must contain the unitary matrix Q from the reduction to Hessenberg form.

If **compz** = Nag_InitZ, **z** need not be set.

On exit: if **compz** = Nag_UpdateZ or Nag_InitZ, **z** contains the unitary matrix of the required Schur vectors, unless **fail**.**code** = NE_CONVERGENCE.

If **compz** = Nag_NotZ, **z** is not referenced.

11: **pdz** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) in the array **z**.

Constraints:

if **compz** = Nag_UpdateZ or Nag_InitZ, **pdz** $\geq \max(1, \mathbf{n})$;
if **compz** = Nag_NotZ, **pdz** ≥ 1.

12: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.
See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

NE_BAD_PARAM

On entry, argument ⟨*value*⟩ had an illegal value.

NE_CONVERGENCE

The algorithm has failed to find all the eigenvalues after a total of $30(\mathbf{ihi} - \mathbf{ilo} + 1)$ iterations.

NE_ENUM_INT_2

On entry, **compz** = ⟨*value*⟩, **pdz** = ⟨*value*⟩ and **n** = ⟨*value*⟩.
Constraint: if **compz** = Nag_UpdateZ or Nag_InitZ, $\mathbf{pdz} \geq \max(1, \mathbf{n})$;
if **compz** = Nag_NotZ, $\mathbf{pdz} \geq 1$.

NE_INT

On entry, **n** = ⟨*value*⟩.
Constraint: $\mathbf{n} \geq 0$.

On entry, **pdh** = ⟨*value*⟩.
Constraint: $\mathbf{pdh} > 0$.

On entry, **pdz** = ⟨*value*⟩.
Constraint: $\mathbf{pdz} > 0$.

NE_INT_2

On entry, **pdh** = ⟨*value*⟩ and **n** = ⟨*value*⟩.
Constraint: $\mathbf{pdh} \geq \max(1, \mathbf{n})$.

NE_INT_3

On entry, **n** = ⟨*value*⟩, **ilo** = ⟨*value*⟩ and **ihi** = ⟨*value*⟩.
Constraint: $\mathbf{ilo} \geq 1$ and $\min(\mathbf{ilo}, \mathbf{n}) \leq \mathbf{ihi} \leq \mathbf{n}$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.
See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

7 Accuracy

The computed Schur factorization is the exact factorization of a nearby matrix $(H + E)$, where

$$\|E\|_2 = O(\epsilon)\|H\|_2,$$

and ϵ is the ***machine precision***.

If λ_i is an exact eigenvalue, and $\tilde{\lambda}_i$ is the corresponding computed value, then

$$\left|\tilde{\lambda}_i - \lambda_i\right| \leq \frac{c(n)\epsilon\|H\|_2}{s_i},$$

where $c(n)$ is a modestly increasing function of n, and s_i is the reciprocal condition number of λ_i. The condition numbers s_i may be computed by calling nag_ztrsna (f08qyc).

8 Parallelism and Performance

nag_zhseqr (f08psc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag_zhseqr (f08psc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of real floating-point operations depends on how rapidly the algorithm converges, but is typically about:

$25n^3$ if only eigenvalues are computed;

$35n^3$ if the Schur form is computed;

$70n^3$ if the full Schur factorization is computed.

The real analogue of this function is nag_dhseqr (f08pec).

10 Example

This example computes all the eigenvalues and the Schur factorization of the upper Hessenberg matrix H, where

$$H = \begin{pmatrix} -3.9700 - 5.0400i & -1.1318 - 2.5693i & -4.6027 - 0.1426i & -1.4249 + 1.7330i \\ -5.4797 + 0.0000i & 1.8585 - 1.5502i & 4.4145 - 0.7638i & -0.4805 - 1.1976i \\ 0.0000 + 0.0000i & 6.2673 + 0.0000i & -0.4504 - 0.0290i & -1.3467 + 1.6579i \\ 0.0000 + 0.0000i & 0.0000 + 0.0000i & -3.5000 + 0.0000i & 2.5619 - 3.3708i \end{pmatrix}.$$

See also Section 10 in nag_zunghr (f08ntc), which illustrates the use of this function to compute the Schur factorization of a general matrix.
