### 3 Description

Given an  $m$  by  $n$  real matrix  $A$  and a  $p$  by  $n$  real matrix  $B$ , the generalized singular value decomposition is given by

$$U^T A Q = D_1 \begin{pmatrix} 0 & R \end{pmatrix}, \quad V^T B Q = D_2 \begin{pmatrix} 0 & R \end{pmatrix},$$

where  $U$ ,  $V$  and  $Q$  are orthogonal matrices. Let  $l$  be the effective numerical rank of  $B$  and  $(k+l)$  be the effective numerical rank of the matrix  $\begin{pmatrix} A \\ B \end{pmatrix}$ , then the first  $k$  generalized singular values are infinite and the remaining  $l$  are finite.  $R$  is a  $(k+l)$  by  $(k+l)$  nonsingular upper triangular matrix,  $D_1$  and  $D_2$  are  $m$  by  $(k+l)$  and  $p$  by  $(k+l)$  ‘diagonal’ matrices structured as follows:

if  $m - k - l \geq 0$ ,

$$D_1 = \begin{matrix} & k & l \\ & \begin{pmatrix} I & 0 \\ 0 & C \end{pmatrix} \\ m-k-l & \begin{pmatrix} 0 & 0 \end{pmatrix} \end{matrix}$$

$$D_2 = \begin{matrix} & k & l \\ & \begin{pmatrix} 0 & S \\ 0 & 0 \end{pmatrix} \\ p-l & \end{matrix}$$

$$\begin{pmatrix} 0 & R \end{pmatrix} = \begin{matrix} & n-k-l & k & l \\ k & \begin{pmatrix} 0 & R_{11} & R_{12} \\ 0 & 0 & R_{22} \end{pmatrix} \\ l & \end{matrix}$$

where

$$C = \text{diag}(\alpha_{k+1}, \dots, \alpha_{k+l}),$$

$$S = \text{diag}(\beta_{k+1}, \dots, \beta_{k+l}),$$

and

$$C^2 + S^2 = I.$$

$R$  is stored as a submatrix of  $A$  with elements  $R_{ij}$  stored as  $A_{i,n-k-l+j}$  on exit.

If  $m - k - l < 0$ ,

$$D_1 = \begin{matrix} & k & m-k & k+l-m \\ & \begin{pmatrix} I & 0 & 0 \\ 0 & C & 0 \end{pmatrix} \\ m-k & \end{matrix}$$

$$D_2 = \begin{matrix} & k & m-k & k+l-m \\ m-k & \begin{pmatrix} 0 & S & 0 \\ 0 & 0 & I \\ p-l & 0 & 0 \end{pmatrix} \\ k+l-m & \end{matrix}$$

$$(0 \ R) = \begin{matrix} & n-k-l & k & m-k & k+l-m \\ & \begin{pmatrix} 0 & R_{11} & R_{12} & R_{13} \\ 0 & 0 & R_{22} & R_{23} \\ k+l-m & 0 & 0 & R_{33} \end{pmatrix} \\ m-k & \end{matrix}$$

where

$$C = \text{diag}(\alpha_{k+1}, \dots, \alpha_m),$$

$$S = \text{diag}(\beta_{k+1}, \dots, \beta_m),$$

and

$$C^2 + S^2 = I.$$

$\begin{pmatrix} R_{11} & R_{12} & R_{13} \\ 0 & R_{22} & R_{23} \end{pmatrix}$  is stored as a submatrix of  $A$  with  $R_{ij}$  stored as  $A_{i,n-k-l+j}$ , and  $R_{33}$  is stored as a submatrix of  $B$  with  $(R_{33})_{ij}$  stored as  $B_{m-k+i,n+m-k-l+j}$ .

The function computes  $C$ ,  $S$ ,  $R$  and, optionally, the orthogonal transformation matrices  $U$ ,  $V$  and  $Q$ .

In particular, if  $B$  is an  $n$  by  $n$  nonsingular matrix, then the GSVD of  $A$  and  $B$  implicitly gives the SVD of  $AB^{-1}$ :

$$AB^{-1} = U(D_1 D_2^{-1})V^T.$$

If  $\begin{pmatrix} A \\ B \end{pmatrix}$  has orthonormal columns, then the GSVD of  $A$  and  $B$  is also equal to the CS decomposition of  $A$  and  $B$ . Furthermore, the GSVD can be used to derive the solution of the eigenvalue problem:

$$A^T A x = \lambda B^T B x.$$

In some literature, the GSVD of  $A$  and  $B$  is presented in the form

$$U^T A X = (0 \ D_1), \quad V^T B X = (0 \ D_2),$$

where  $U$  and  $V$  are orthogonal and  $X$  is nonsingular, and  $D_1$  and  $D_2$  are ‘diagonal’. The former GSVD form can be converted to the latter form by setting

$$X = Q \begin{pmatrix} I & 0 \\ 0 & R^{-1} \end{pmatrix}.$$

A two stage process is used to compute the GSVD of the matrix pair  $(A, B)$ . The pair is first reduced to upper triangular form by orthogonal transformations using `nag_dggsvp3` (f08vge). The GSVD of the resulting upper triangular matrix pair is then performed by `nag_dtgsja` (f08yec) which uses a variant of the Kogbetliantz algorithm (a cyclic Jacobi method).

## 8 Parallelism and Performance

nag\_dggsvd3 (f08vcc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag\_dggsvd3 (f08vcc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

This function replaces the deprecated function nag\_dggsvd (f08vac) which used an unblocked algorithm and therefore did not make best use of level 3 BLAS functions.

The complex analogue of this function is nag\_zggsvd3 (f08vqc).

## 10 Example

This example finds the generalized singular value decomposition

$$A = U\Sigma_1(0 \ R)Q^T, \quad B = V\Sigma_2(0 \ R)Q^T,$$

where

$$A = \begin{pmatrix} 1 & 2 & 3 \\ 3 & 2 & 1 \\ 4 & 5 & 6 \\ 7 & 8 & 8 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} -2 & -3 & 3 \\ 4 & 6 & 5 \end{pmatrix},$$

together with estimates for the condition number of  $R$  and the error bound for the computed generalized singular values.

The example program assumes that  $m \geq n$ , and would need slight modification if this is not the case.
