

# NAG Library Function Document

## nag\_ztgsna (f08yyc)

### 1 Purpose

nag\_ztgsna (f08yyc) estimates condition numbers for specified eigenvalues and/or eigenvectors of a complex matrix pair in generalized Schur form.

### 2 Specification

```
#include <nag.h>
#include <nagf08.h>

void nag_ztgsna (Nag_OrderType order, Nag_JobType job,
    Nag_HowManyType how_many, const Nag_Boolean select[], Integer n,
    const Complex a[], Integer pda, const Complex b[], Integer pdb,
    const Complex vl[], Integer pdvl, const Complex vr[], Integer pdvr,
    double s[], double dif[], Integer mm, Integer *m, NagError *fail)
```

### 3 Description

nag\_ztgsna (f08yyc) estimates condition numbers for specified eigenvalues and/or right eigenvectors of an  $n$  by  $n$  matrix pair  $(S, T)$  in generalized Schur form. The function actually returns estimates of the reciprocals of the condition numbers in order to avoid possible overflow.

The pair  $(S, T)$  are in generalized Schur form if  $S$  and  $T$  are upper triangular as returned, for example, by nag\_zgges (f08xnc) or nag\_zggesx (f08xpc), or nag\_zhgeqz (f08xsc) with **job** = Nag\_Schur. The diagonal elements define the generalized eigenvalues  $(\alpha_i, \beta_i)$ , for  $i = 1, 2, \dots, n$ , of the pair  $(S, T)$  and the eigenvalues are given by

$$\lambda_i = \alpha_i / \beta_i,$$

so that

$$\beta_i S x_i = \alpha_i T x_i \quad \text{or} \quad S x_i = \lambda_i T x_i,$$

where  $x_i$  is the corresponding (right) eigenvector.

If  $S$  and  $T$  are the result of a generalized Schur factorization of a matrix pair  $(A, B)$

$$A = Q S Z^H, \quad B = Q T Z^H$$

then the eigenvalues and condition numbers of the pair  $(S, T)$  are the same as those of the pair  $(A, B)$ .

Let  $(\alpha, \beta) \neq (0, 0)$  be a simple generalized eigenvalue of  $(A, B)$ . Then the reciprocal of the condition number of the eigenvalue  $\lambda = \alpha / \beta$  is defined as

$$s(\lambda) = \frac{\left( |y^H A x|^2 + |y^H B x|^2 \right)^{1/2}}{(\|x\|_2 \|y\|_2)},$$

where  $x$  and  $y$  are the right and left eigenvectors of  $(A, B)$  corresponding to  $\lambda$ . If both  $\alpha$  and  $\beta$  are zero, then  $(A, B)$  is singular and  $s(\lambda) = -1$  is returned.

If  $U$  and  $V$  are unitary transformations such that

$$U^H(A, B)V = (S, T) = \begin{pmatrix} \alpha & * \\ 0 & S_{22} \end{pmatrix} \begin{pmatrix} \beta & * \\ 0 & T_{22} \end{pmatrix},$$

where  $S_{22}$  and  $T_{22}$  are  $(n - 1)$  by  $(n - 1)$  matrices, then the reciprocal condition number is given by

$$\text{Dif}(x) \equiv \text{Dif}(y) = \text{Dif}((\alpha, \beta), (S_{22}, T_{22})) = \sigma_{\min}(Z),$$

where  $\sigma_{\min}(Z)$  denotes the smallest singular value of the  $2(n-1)$  by  $2(n-1)$  matrix

$$Z = \begin{pmatrix} \alpha \otimes I & -1 \otimes S_{22} \\ \beta \otimes I & -1 \otimes T_{22} \end{pmatrix}$$

and  $\otimes$  is the Kronecker product.

See Sections 2.4.8 and 4.11 of Anderson *et al.* (1999) and K  gstr  m and Poromaa (1996) for further details and information.

## 5 Arguments

- 1: **order** – Nag\_OrderType *Input*  
*On entry:* the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag\_RowMajor. See Section 2.3.1.3 in How to Use the NAG Library and its Documentation for a more detailed explanation of the use of this argument.  
*Constraint:* **order** = Nag\_RowMajor or Nag\_ColMajor.
- 2: **job** – Nag\_JobType *Input*  
*On entry:* indicates whether condition numbers are required for eigenvalues and/or eigenvectors.  
**job** = Nag\_EigVals  
Condition numbers for eigenvalues only are computed.  
**job** = Nag\_EigVecs  
Condition numbers for eigenvectors only are computed.  
**job** = Nag\_DoBoth  
Condition numbers for both eigenvalues and eigenvectors are computed.  
*Constraint:* **job** = Nag\_EigVals, Nag\_EigVecs or Nag\_DoBoth.
- 3: **how\_many** – Nag\_HowManyType *Input*  
*On entry:* indicates how many condition numbers are to be computed.  
**how\_many** = Nag\_ComputeAll  
Condition numbers for all eigenpairs are computed.  
**how\_many** = Nag\_ComputeSelected  
Condition numbers for selected eigenpairs (as specified by **select**) are computed.  
*Constraint:* **how\_many** = Nag\_ComputeAll or Nag\_ComputeSelected.
- 4: **select**[*dim*] – const Nag\_Boolean *Input*  
**Note:** the dimension, *dim*, of the array **select** must be at least  
**n** when **how\_many** = Nag\_ComputeSelected;  
otherwise **select** may be **NULL**.

*On entry:* specifies the eigenpairs for which condition numbers are to be computed if **how\_many** = Nag\_ComputeSelected. To select condition numbers for the eigenpair corresponding to the eigenvalue  $\lambda_j$ , **select**[ $j - 1$ ] must be set to Nag\_TRUE.

If **how\_many** = Nag\_ComputeAll, **select** is not referenced and may be NULL.

5: **n** – Integer *Input*

*On entry:*  $n$ , the order of the matrix pair  $(S, T)$ .

*Constraint:*  $n \geq 0$ .

6: **a**[ $dim$ ] – const Complex *Input*

**Note:** the dimension,  $dim$ , of the array **a** must be at least **pda**  $\times$  **n**.

The  $(i, j)$ th element of the matrix  $A$  is stored in

**a**[ $(j - 1) \times \mathbf{pda} + i - 1$ ] when **order** = Nag\_ColMajor;  
**a**[ $(i - 1) \times \mathbf{pda} + j - 1$ ] when **order** = Nag\_RowMajor.

*On entry:* the upper triangular matrix  $S$ .

7: **pda** – Integer *Input*

*On entry:* the stride separating row or column elements (depending on the value of **order**) in the array **a**.

*Constraint:* **pda**  $\geq$  **n**.

8: **b**[ $dim$ ] – const Complex *Input*

**Note:** the dimension,  $dim$ , of the array **b** must be at least **pdb**  $\times$  **n**.

The  $(i, j)$ th element of the matrix  $B$  is stored in

**b**[ $(j - 1) \times \mathbf{pdb} + i - 1$ ] when **order** = Nag\_ColMajor;  
**b**[ $(i - 1) \times \mathbf{pdb} + j - 1$ ] when **order** = Nag\_RowMajor.

*On entry:* the upper triangular matrix  $T$ .

9: **pdb** – Integer *Input*

*On entry:* the stride separating row or column elements (depending on the value of **order**) in the array **b**.

*Constraint:* **pdb**  $\geq$  **n**.

10: **vl**[ $dim$ ] – const Complex *Input*

**Note:** the dimension,  $dim$ , of the array **vl** must be at least

**pdvl**  $\times$  **mm** when **job** = Nag\_EigVals or Nag\_DoBoth and **order** = Nag\_ColMajor;  
**n**  $\times$  **pdvl** when **job** = Nag\_EigVals or Nag\_DoBoth and **order** = Nag\_RowMajor;  
otherwise **vl** may be NULL.

The  $i$ th element of the  $j$ th vector is stored in

**vl**[ $(j - 1) \times \mathbf{pdvl} + i - 1$ ] when **order** = Nag\_ColMajor;  
**vl**[ $(i - 1) \times \mathbf{pdvl} + j - 1$ ] when **order** = Nag\_RowMajor.

*On entry:* if **job** = Nag\_EigVals or Nag\_DoBoth, **vl** must contain left eigenvectors of  $(S, T)$ , corresponding to the eigenpairs specified by **how\_many** and **select**. The eigenvectors must be stored in consecutive columns of **vl**, as returned by nag\_zggeev (f08wnc) or nag\_ztgevc (f08yxc).

If **job** = Nag\_EigVecs, **vl** is not referenced and may be NULL.

- 11: **pdvl** – Integer *Input*  
*On entry:* the stride used in the array **vl**.  
*Constraints:*  
 if **order** = Nag\_ColMajor,  
     if **job** = Nag\_EigVals or Nag\_DoBoth, **pdvl**  $\geq$  **n**;  
     otherwise **pdvl**  $\geq$  1.;  
 if **order** = Nag\_RowMajor,  
     if **job** = Nag\_EigVals or Nag\_DoBoth, **pdvl**  $\geq$  **mm**;  
     otherwise **vl** may be **NULL**..
- 12: **vr**[*dim*] – const Complex *Input*  
**Note:** the dimension, *dim*, of the array **vr** must be at least  
**pdvr**  $\times$  **mm** when **job** = Nag\_EigVals or Nag\_DoBoth and **order** = Nag\_ColMajor;  
**n**  $\times$  **pdvr** when **job** = Nag\_EigVals or Nag\_DoBoth and **order** = Nag\_RowMajor;  
 otherwise **vr** may be **NULL**.  
 The *i*th element of the *j*th vector is stored in  
**vr**[(*j* – 1)  $\times$  **pdvr** + *i* – 1] when **order** = Nag\_ColMajor;  
**vr**[(*i* – 1)  $\times$  **pdvr** + *j* – 1] when **order** = Nag\_RowMajor.  
*On entry:* if **job** = Nag\_EigVals or Nag\_DoBoth, **vr** must contain right eigenvectors of (*S*, *T*), corresponding to the eigenpairs specified by **how\_many** and **select**. The eigenvectors must be stored in consecutive columns of **vr**, as returned by nag\_zggevc (f08wnc) or nag\_ztgevc (f08yxc).  
 If **job** = Nag\_EigVecs, **vr** is not referenced and may be **NULL**.
- 13: **pdvr** – Integer *Input*  
*On entry:* the stride used in the array **vr**.  
*Constraints:*  
 if **order** = Nag\_ColMajor,  
     if **job** = Nag\_EigVals or Nag\_DoBoth, **pdvr**  $\geq$  **n**;  
     otherwise **pdvr**  $\geq$  1.;  
 if **order** = Nag\_RowMajor,  
     if **job** = Nag\_EigVals or Nag\_DoBoth, **pdvr**  $\geq$  **mm**;  
     otherwise **vr** may be **NULL**..
- 14: **s**[*dim*] – double *Output*  
**Note:** the dimension, *dim*, of the array **s** must be at least  
**mm** when **job** = Nag\_EigVals or Nag\_DoBoth;  
 otherwise **s** may be **NULL**.  
*On exit:* if **job** = Nag\_EigVals or Nag\_DoBoth, the reciprocal condition numbers of the selected eigenvalues, stored in consecutive elements of the array.  
 If **job** = Nag\_EigVecs, **s** is not referenced and may be **NULL**.
- 15: **dif**[*dim*] – double *Output*  
**Note:** the dimension, *dim*, of the array **dif** must be at least  
**mm** when **job** = Nag\_EigVecs or Nag\_DoBoth;  
 otherwise **dif** may be **NULL**.  
*On exit:* if **job** = Nag\_EigVecs or Nag\_DoBoth, the estimated reciprocal condition numbers of the selected eigenvectors, stored in consecutive elements of the array. If the eigenvalues cannot be

reordered to compute **dif**[*j* – 1], **dif**[*j* – 1] is set to 0; this can only occur when the true value would be very small anyway.

If **job** = Nag\_EigVals, **dif** is not referenced and may be NULL.

16: **mm** – Integer

*Input*

*On entry:* the number of elements in the arrays **s** and **dif**.

*Constraints:*

if **how\_many** = Nag\_ComputeAll, **mm** ≥ **n**;  
otherwise **mm** ≥ the number of selected eigenvalues.

17: **m** – Integer \*

*Output*

*On exit:* the number of elements of the arrays **s** and **dif** used to store the specified condition numbers; for each selected eigenvalue one element is used.

If **how\_many** = Nag\_ComputeAll, **m** is set to **n**.

18: **fail** – NagError \*

*Input/Output*

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

### NE\_BAD\_PARAM

*On entry,* argument *⟨value⟩* had an illegal value.

### NE\_ENUM\_INT\_2

*On entry,* **how\_many** = *⟨value⟩*, **n** = *⟨value⟩* and **mm** = *⟨value⟩*.

Constraint: if **how\_many** = Nag\_ComputeAll, **mm** ≥ **n**;  
otherwise **mm** ≥ the number of selected eigenvalues.

*On entry,* **job** = *⟨value⟩*, **pdvl** = *⟨value⟩*, **mm** = *⟨value⟩*.

Constraint: if **job** = Nag\_EigVals or Nag\_DoBoth, **pdvl** ≥ **mm**.

*On entry,* **job** = *⟨value⟩*, **pdvl** = *⟨value⟩* and **n** = *⟨value⟩*.

Constraint: if **job** = Nag\_EigVals or Nag\_DoBoth, **pdvl** ≥ **n**.

*On entry,* **job** = *⟨value⟩*, **pdvr** = *⟨value⟩*, **mm** = *⟨value⟩*.

Constraint: if **job** = Nag\_EigVals or Nag\_DoBoth, **pdvr** ≥ **mm**.

*On entry,* **job** = *⟨value⟩*, **pdvr** = *⟨value⟩* and **n** = *⟨value⟩*.

Constraint: if **job** = Nag\_EigVals or Nag\_DoBoth, **pdvr** ≥ **n**.

### NE\_INT

*On entry,* **n** = *⟨value⟩*.

Constraint: **n** > 0.

*On entry,* **n** = *⟨value⟩*.

Constraint: **n** ≥ 0.

*On entry,* **pda** = *⟨value⟩*.

Constraint: **pda** > 0.

On entry, **pdb** =  $\langle value \rangle$ .

Constraint: **pdb** > 0.

On entry, **pdbl** =  $\langle value \rangle$ .

Constraint: **pdbl** > 0.

On entry, **pdbl** =  $\langle value \rangle$ .

Constraint: **pdbl** > 0.

## NE\_INT\_2

On entry, **pda** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint: **pda** ≥ **n**.

On entry, **pdb** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint: **pdb** ≥ **n**.

## NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

## NE\_NO\_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

## 7 Accuracy

None.

## 8 Parallelism and Performance

nag\_ztgsna (f08yyc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

An approximate asymptotic error bound on the chordal distance between the computed eigenvalue  $\tilde{\lambda}$  and the corresponding exact eigenvalue  $\lambda$  is

$$\chi(\tilde{\lambda}, \lambda) \leq \epsilon \|(A, B)\|_F / S(\lambda)$$

where  $\epsilon$  is the *machine precision*.

An approximate asymptotic error bound for the right or left computed eigenvectors  $\tilde{x}$  or  $\tilde{y}$  corresponding to the right and left eigenvectors  $x$  and  $y$  is given by

$$\theta(\tilde{z}, z) \leq \epsilon \|(A, B)\|_F / \text{Dif}.$$

The real analogue of this function is nag\_dtgsna (f08ylc).

## 10 Example

This example estimates condition numbers and approximate error estimates for all the eigenvalues and right eigenvectors of the pair  $(S, T)$  given by

$$S = \begin{pmatrix} 4.0 + 4.0i & 1.0 + 1.0i & 1.0 + 1.0i & 2.0 - 1.0i \\ 0 & 2.0 + 1.0i & 1.0 + 1.0i & 1.0 + 1.0i \\ 0 & 0 & 2.0 - 1.0i & 1.0 + 1.0i \\ 0 & 0 & 0 & 6.0 - 2.0i \end{pmatrix}$$

and

$$T = \begin{pmatrix} 2.0 & 1.0 + 1.0i & 1.0 + 1.0i & 3.0 - 1.0i \\ 0 & 1.0 & 2.0 + 1.0i & 1.0 + 1.0i \\ 0 & 0 & 1.0 & 1.0 + 1.0i \\ 0 & 0 & 0 & 2.0 \end{pmatrix}.$$

The eigenvalues and eigenvectors are computed by calling `nag_ztgevc` (f08yxc).

## 10.3 Program Results

nag\_ztgsna (f08yyc) Example Program Results

Condition numbers of eigenvalues (scon) and right eigenvectors (diff),

scon:	1.0e+00	8.2e-01	7.2e-01	8.2e-01
dif:	3.2e-01	3.6e-01	5.5e-01	2.8e-01

Approximate error estimates for eigenvalues of (S,T)

Error estimates for eigenvalues (errval) and right eigenvectors (errvec),

errval:	1.5e-15	1.9e-15	2.1e-15	1.9e-15
errvec:	4.8e-15	4.3e-15	2.8e-15	5.5e-15
