## nag\_sparse\_nsym\_sol (f11dec)

### 1 Purpose

nag\_sparse\_nsym\_sol (f11dec) solves a real sparse nonsymmetric system of linear equations, represented in coordinate storage format, using a restarted generalized minimal residual (RGMRES), conjugate gradient squared (CGS), or stabilized bi-conjugate gradient (Bi-CGSTAB) method, without preconditioning, with Jacobi, or with SSOR preconditioning.

### 2 Specification

```
#include <nag.h>
#include <nagf11.h>

void nag_sparse_nsym_sol (Nag_SparseNsym_Method method,
    Nag_SparseNsym_PrecType precon, Integer n, Integer nnz,
    const double a[], const Integer irow[], const Integer icol[],
    double omega, const double b[], Integer m, double tol, Integer maxitn,
    double x[], double *rnorm, Integer *itn, Nag_Sparse_Comm *comm,
    NagError *fail)
```

### 3 Description

nag\_sparse\_nsym\_sol (f11dec) solves a real sparse nonsymmetric system of linear equations:

$$Ax = b,$$

using an RGMRES (see Saad and Schultz (1986)), CGS (see Sonneveld (1989)), or Bi-CGSTAB( $\ell$ ) method (see Van der Vorst (1989), Sleijpen and Fokkema (1993)).

The function allows the following choices for the preconditioner:

no preconditioning;

Jacobi preconditioning (see Young (1971));

symmetric successive-over-relaxation (SSOR) preconditioning (see Young (1971)).

For incomplete  $LU$  (ILU) preconditioning see nag\_sparse\_nsym\_fac\_sol (f11dec).

The matrix  $A$  is represented in coordinate storage (CS) format (see the f11 Chapter Introduction) in the arrays **a**, **irow** and **icol**. The array **a** holds the nonzero entries in the matrix, while **irow** and **icol** hold the corresponding row and column indices.

## 5 Arguments

- 1: **method** – Nag\_SparseNsym\_Method *Input*  
*On entry:* specifies the iterative method to be used.  
**method** = Nag\_SparseNsym\_RGMRES  
The restarted generalized minimum residual method is used.  
**method** = Nag\_SparseNsym\_CGS  
The conjugate gradient squared method is used.  
**method** = Nag\_SparseNsym\_BiCGSTAB  
The bi-conjugate gradient stabilised ( $\ell$ ) method is used.  
*Constraint:* **method** = Nag\_SparseNsym\_RGMRES, Nag\_SparseNsym\_CGS o r Nag\_SparseNsym\_BiCGSTAB.
- 2: **precon** – Nag\_SparseNsym\_PrecType *Input*  
*On entry:* specifies the type of preconditioning to be used.  
**precon** = Nag\_SparseNsym\_NoPrec  
No preconditioning.  
**precon** = Nag\_SparseNsym\_SSORPrec  
Symmetric successive-over-relaxation.  
**precon** = Nag\_SparseNsym\_JacPrec  
Jacobi.  
*Constraint:* **precon** = Nag\_SparseNsym\_NoPrec, Nag\_SparseNsym\_SSORPrec o r Nag\_SparseNsym\_JacPrec.
- 3: **n** – Integer *Input*  
*On entry:* the order of the matrix  $A$ .  
*Constraint:*  $n \geq 1$ .
- 4: **nnz** – Integer *Input*  
*On entry:* the number of nonzero elements in the matrix  $A$ .  
*Constraint:*  $1 \leq \text{nnz} \leq n^2$ .
- 5: **a[nnz]** – const double *Input*  
*On entry:* the nonzero elements of the matrix  $A$ , ordered by increasing row index, and by increasing column index within each row. Multiple entries for the same row and column indices are not permitted. The function nag\_sparse\_nsym\_sort (f11zac) may be used to order the elements in this way.
- 6: **irow[nnz]** – const Integer *Input*
- 7: **icol[nnz]** – const Integer *Input*  
*On entry:* the row and column indices of the nonzero elements supplied in **a**.  
*Constraints:*  
**irow** and **icol** must satisfy the following constraints (which may be imposed by a call to nag\_sparse\_nsym\_sort (f11zac));  
 $1 \leq \text{irow}[i] \leq n$  and  $1 \leq \text{icol}[i] \leq n$ , for  $i = 0, 1, \dots, \text{nnz} - 1$ ;  
**irow** $[i - 1] < \text{irow}[i]$  or **irow** $[i - 1] = \text{irow}[i]$  and **icol** $[i - 1] < \text{icol}[i]$ , for  $i = 1, 2, \dots, \text{nnz} - 1$ .

- 8: **omega** – double *Input*  
*On entry:* if **precon** = Nag\_SparseNsym\_SSORPrec, **omega** is the relaxation argument  $\omega$  to be used in the SSOR method. Otherwise **omega** need not be initialized and is not referenced.  
*Constraint:*  $0.0 < \mathbf{omega} < 2.0$ .
- 9: **b[n]** – const double *Input*  
*On entry:* the right-hand side vector  $b$ .
- 10: **m** – Integer *Input*  
*On entry:* if **method** = Nag\_SparseNsym\_RGMRES, **m** is the dimension of the restart subspace.  
 If **method** = Nag\_SparseNsym\_BiCGSTAB, **m** is the order  $\ell$  of the polynomial Bi-CGSTAB method; otherwise **m** is not referenced.  
*Constraints:*  
     if **method** = Nag\_SparseNsym\_RGMRES,  $0 < \mathbf{m} \leq \min(\mathbf{n}, 50)$ ;  
     if **method** = Nag\_SparseNsym\_BiCGSTAB,  $0 < \mathbf{m} \leq \min(\mathbf{n}, 10)$ .
- 11: **tol** – double *Input*  
*On entry:* the required tolerance. Let  $x_k$  denote the approximate solution at iteration  $k$ , and  $r_k$  the corresponding residual. The algorithm is considered to have converged at iteration  $k$  if:  

$$\|r_k\|_{\infty} \leq \tau \times (\|b\|_{\infty} + \|A\|_{\infty} \|x_k\|_{\infty}).$$
 If **tol**  $\leq 0.0$ ,  $\tau = \max(\sqrt{\epsilon}, \sqrt{\mathbf{n}}, \epsilon)$  is used, where  $\epsilon$  is the *machine precision*. Otherwise  $\tau = \max(\mathbf{tol}, 10\epsilon, \sqrt{\mathbf{n}}, \epsilon)$  is used.  
*Constraint:* **tol**  $< 1.0$ .
- 12: **maxitn** – Integer *Input*  
*On entry:* the maximum number of iterations allowed.  
*Constraint:* **maxitn**  $\geq 1$ .
- 13: **x[n]** – double *Input/Output*  
*On entry:* an initial approximation to the solution vector  $x$ .  
*On exit:* an improved approximation to the solution vector  $x$ .
- 14: **rnorm** – double \* *Output*  
*On exit:* the final value of the residual norm  $\|r_k\|_{\infty}$ , where  $k$  is the output value of **itn**.
- 15: **itn** – Integer \* *Output*  
*On exit:* the number of iterations carried out.
- 16: **comm** – Nag\_Sparse\_Comm \* *Input/Output*  
*On entry/exit:* a pointer to a structure of type Nag\_Sparse\_Comm whose members are used by the iterative solver.
- 17: **fail** – NagError \* *Input/Output*  
 The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

## 6 Error Indicators and Warnings

### NE\_ACC\_LIMIT

The required accuracy could not be obtained. However, a reasonable accuracy has been obtained and further iterations cannot improve the result.

You should check the output value of **rnorm** for acceptability. This error code usually implies that your problem has been fully and satisfactorily solved to within or close to the accuracy available on your system. Further iterations are unlikely to improve on this situation.

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

### NE\_BAD\_PARAM

On entry, argument **method** had an illegal value.

On entry, argument **precon** had an illegal value.

### NE\_INT\_2

On entry, **m** =  $\langle value \rangle$ ,  $\min(\mathbf{n}, 10) = \langle value \rangle$ .

Constraint:  $0 < \mathbf{m} \leq \min(\mathbf{n}, 10)$  when **method** = Nag\_SparseNsym\_BiCGSTAB.

On entry, **m** =  $\langle value \rangle$ ,  $\min(\mathbf{n}, 50) = \langle value \rangle$ .

Constraint:  $0 < \mathbf{m} \leq \min(\mathbf{n}, 50)$  when **method** = Nag\_SparseNsym\_RGMRES.

On entry, **nnz** =  $\langle value \rangle$ , **n** =  $\langle value \rangle$ .

Constraint:  $1 \leq \mathbf{nnz} \leq \mathbf{n}^2$ .

### NE\_INT\_ARG\_LT

On entry, **maxitn** =  $\langle value \rangle$ .

Constraint: **maxitn**  $\geq 1$ .

On entry, **n** =  $\langle value \rangle$ .

Constraint: **n**  $\geq 1$ .

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

### NE\_NONSYMM\_MATRIX\_DUP

A nonzero matrix element has been supplied which does not lie within the matrix *A*, is out of order or has duplicate row and column indices, i.e., one or more of the following constraints has been violated:

$1 \leq \mathbf{irow}[i] \leq \mathbf{n}$  and  $1 \leq \mathbf{icol}[i] \leq \mathbf{n}$ , for  $i = 0, 1, \dots, \mathbf{nnz} - 1$ .

$\mathbf{irow}[i - 1] < \mathbf{irow}[i]$ , or

$\mathbf{irow}[i - 1] = \mathbf{irow}[i]$  and  $\mathbf{icol}[i - 1] < \mathbf{icol}[i]$ , for  $i = 1, 2, \dots, \mathbf{nnz} - 1$ .

Call `nag_sparse_nsym_sort (f11zac)` to reorder and sum or remove duplicates.

### NE\_NOT\_REQ\_ACC

The required accuracy has not been obtained in **maxitn** iterations.

### NE\_REAL

On entry, **omega** =  $\langle value \rangle$ .

Constraint:  $0.0 < \mathbf{omega} < 2.0$  when **precon** = Nag\_SparseNsym\_SSORPrec.

**NE\_REAL\_ARG\_GE**

On entry, **tol** must not be greater than or equal to 1: **tol** =  $\langle value \rangle$ .

**NE\_ZERO\_DIAGONAL\_ELEM**

On entry, the matrix **a** has a zero diagonal element. Jacobi and SSOR preconditioners are not appropriate for this problem.

**7 Accuracy**

On successful termination, the final residual  $r_k = b - Ax_k$ , where  $k = \mathbf{itn}$ , satisfies the termination criterion

$$\|r_k\|_\infty \leq \tau \times (\|b\|_\infty + \|A\|_\infty \|x_k\|_\infty).$$

The value of the final residual norm is returned in **rnorm**.

**8 Parallelism and Performance**

nag\_sparse\_nsym\_sol (f11dec) is not threaded in any implementation.

**9 Further Comments**

The time taken by nag\_sparse\_nsym\_sol (f11dec) for each iteration is roughly proportional to **nnz**.

The number of iterations required to achieve a prescribed accuracy cannot be easily determined a priori, as it can depend dramatically on the conditioning and spectrum of the preconditioned matrix of the coefficients  $\bar{A} = M^{-1}A$ .

**10 Example**

This example program solves a sparse nonsymmetric system of equations using the RGMRES method, with SSOR preconditioning.
