

## NAG Library Function Document

### nag\_sparse\_nsym\_precon\_bdilu\_solve (f11dgc)

#### 1 Purpose

nag\_sparse\_nsym\_precon\_bdilu\_solve (f11dgc) solves a real sparse nonsymmetric system of linear equations, represented in coordinate storage format, using a restarted generalized minimal residual (RGMRES), conjugate gradient squared (CGS), stabilized bi-conjugate gradient (Bi-CGSTAB), or transpose-free quasi-minimal residual (TFQMR) method, with block Jacobi or additive Schwarz preconditioning.

#### 2 Specification

```
#include <nag.h>
#include <nagf11.h>

void nag_sparse_nsym_precon_bdilu_solve (Nag_SparseNsym_Method method,
    Integer n, Integer nnz, const double a[], Integer la,
    const Integer irow[], const Integer icol[], Integer nb,
    const Integer istb[], const Integer indb[], Integer lindb,
    const Integer ipivp[], const Integer ipivq[], const Integer istr[],
    const Integer iddiag[], const double b[], Integer m, double tol,
    Integer maxitn, double x[], double *rnorm, Integer *itn, NagError *fail)
```

#### 3 Description

nag\_sparse\_nsym\_precon\_bdilu\_solve (f11dgc) solves a real sparse nonsymmetric linear system of equations:

$$Ax = b,$$

using a preconditioned RGMRES (see Saad and Schultz (1986)), CGS (see Sonneveld (1989)), Bi-CGSTAB( $\ell$ ) (see Van der Vorst (1989) and Sleijpen and Fokkema (1993)), or TFQMR (see Freund and Nachtigal (1991) and Freund (1993)) method.

nag\_sparse\_nsym\_precon\_bdilu\_solve (f11dgc) uses the incomplete (possibly overlapping) block  $LU$  factorization determined by nag\_sparse\_nsym\_precon\_bdilu (f11dfc) as the preconditioning matrix. A call to nag\_sparse\_nsym\_precon\_bdilu\_solve (f11dgc) must always be preceded by a call to nag\_sparse\_nsym\_precon\_bdilu (f11dfc). Alternative preconditioners for the same storage scheme are available by calling nag\_sparse\_nsym\_fac\_sol (f11dcc) or nag\_sparse\_nsym\_sol (f11dec).

The matrix  $A$ , and the preconditioning matrix  $M$ , are represented in coordinate storage (CS) format (see Section 2.1.1 in the f11 Chapter Introduction) in the arrays **a**, **irow** and **icol**, as returned from nag\_sparse\_nsym\_precon\_bdilu (f11dfc). The array **a** holds the nonzero entries in these matrices, while **irow** and **icol** hold the corresponding row and column indices.

nag\_sparse\_nsym\_precon\_bdilu\_solve (f11dgc) is a Black Box function which calls nag\_sparse\_nsym\_basic\_setup (f11bdc), nag\_sparse\_nsym\_basic\_solver (f11bec) and nag\_sparse\_nsym\_basic\_diagnostic (f11bfc). If you wish to use an alternative storage scheme, preconditioner, or termination criterion, or require additional diagnostic information, you should call these underlying functions directly.

## 5 Arguments

1: **method** – Nag\_SparseNsym\_Method *Input*

*On entry:* specifies the iterative method to be used.

**method** = Nag\_SparseNsym\_RGMRES  
Restarted generalized minimum residual method.

**method** = Nag\_SparseNsym\_CGS  
Conjugate gradient squared method.

**method** = Nag\_SparseNsym\_BiCGSTAB  
Bi-conjugate gradient stabilized ( $\ell$ ) method.

**method** = Nag\_SparseNsym\_TFQMR  
Transpose-free quasi-minimal residual method.

*C o n s t r a i n t :* **method** = Nag\_SparseNsym\_RGMRES, Nag\_SparseNsym\_CGS,  
Nag\_SparseNsym\_BiCGSTAB or Nag\_SparseNsym\_TFQMR.

2: **n** – Integer *Input*

3: **nnz** – Integer *Input*

4: **a[la]** – const double *Input*

5: **la** – Integer *Input*

6: **irow[la]** – const Integer *Input*

7: **icol[la]** – const Integer *Input*

8: **nb** – Integer *Input*

9: **istb[nb + 1]** – const Integer *Input*

10: **indb[lindb]** – const Integer *Input*

11: **lindb** – Integer *Input*

12: **ipivp[lindb]** – const Integer *Input*

13: **ipivq[lindb]** – const Integer *Input*

14: **istr[lindb + 1]** – const Integer *Input*

15: **idiag[lindb]** – const Integer *Input*

*On entry:* the values returned in arrays **irow**, **icol**, **ipivp**, **ipivq**, **istr** and **idiag** by a previous call to nag\_sparse\_nsym\_precon\_bdilu (f11dfc).

The arrays **istb**, **indb** and **a** together with the the scalars **n**, **nnz**, **la**, **nb** and **lindb** must be the same values that were supplied in the preceding call to nag\_sparse\_nsym\_precon\_bdilu (f11dfc).

16: **b[n]** – const double *Input*

*On entry:* the right-hand side vector **b**.

17: **m** – Integer *Input*

*On entry:* if **method** = Nag\_SparseNsym\_RGMRES, **m** is the dimension of the restart subspace.

If **method** = Nag\_SparseNsym\_BiCGSTAB, **m** is the order  $\ell$  of the polynomial Bi-CGSTAB method. Otherwise, **m** is not referenced.

*Constraints:*

if **method** = Nag\_SparseNsym\_RGMRES,  $0 < \mathbf{m} \leq \min(\mathbf{n}, 50)$ ;  
 if **method** = Nag\_SparseNsym\_BiCGSTAB,  $0 < \mathbf{m} \leq \min(\mathbf{n}, 10)$ .

18: **tol** – double *Input*

*On entry:* the required tolerance. Let  $x_k$  denote the approximate solution at iteration  $k$ , and  $r_k$  the corresponding residual. The algorithm is considered to have converged at iteration  $k$  if

$$\|r_k\|_\infty \leq \tau \times (\|b\|_\infty + \|A\|_\infty \|x_k\|_\infty).$$

If **tol**  $\leq 0.0$ ,  $\tau = \max(\sqrt{\epsilon}, \sqrt{n}\epsilon)$  is used, where  $\epsilon$  is the *machine precision*. Otherwise  $\tau = \max(\mathbf{tol}, 10\epsilon, \sqrt{n}\epsilon)$  is used.

*Constraint:* **tol**  $< 1.0$ .

19: **maxitn** – Integer *Input*

*On entry:* the maximum number of iterations allowed.

*Constraint:* **maxitn**  $\geq 1$ .

20: **x[n]** – double *Input/Output*

*On entry:* an initial approximation to the solution vector  $x$ .

*On exit:* an improved approximation to the solution vector  $x$ .

21: **rnorm** – double \* *Output*

*On exit:* the final value of the residual norm  $\|r_k\|_\infty$ , where  $k$  is the output value of **itn**.

22: **itn** – Integer \* *Output*

*On exit:* the number of iterations carried out.

23: **fail** – NagError \* *Input/Output*

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

## 6 Error Indicators and Warnings

### NE\_ACCURACY

The required accuracy could not be obtained. However a reasonable accuracy may have been achieved. You should check the output value of **rnorm** for acceptability. This error code usually implies that your problem has been fully and satisfactorily solved to within or close to the accuracy available on your system. Further iterations are unlikely to improve on this situation.

### NE\_ALG\_FAIL

Algorithmic breakdown. A solution is returned, although it is possible that it is completely inaccurate.

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

**NE\_BAD\_PARAM**

On entry, argument  $\langle value \rangle$  had an illegal value.

**NE\_CONVERGENCE**

The solution has not converged after  $\langle value \rangle$  iterations.

**NE\_INT**

On entry, **istb**[0] =  $\langle value \rangle$ .

Constraint: **istb**[0]  $\geq 1$ .

On entry, **maxitn** =  $\langle value \rangle$ .

Constraint: **maxitn**  $\geq 1$ .

On entry, **n** =  $\langle value \rangle$ .

Constraint: **n**  $\geq 1$ .

On entry, **nnz** =  $\langle value \rangle$ .

Constraint: **nnz**  $\geq 1$ .

**NE\_INT\_2**

On entry, **la** =  $\langle value \rangle$  and **nnz** =  $\langle value \rangle$ .

Constraint: **la**  $\geq 2 \times \mathbf{nnz}$ .

On entry, **nb** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint:  $1 \leq \mathbf{nb} \leq \mathbf{n}$ .

On entry, **nnz** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint: **nnz**  $\leq \mathbf{n}^2$ .

**NE\_INT\_3**

On entry, **lindb** =  $\langle value \rangle$ , **istb**[**nb**] - 1 =  $\langle value \rangle$  and **nb** =  $\langle value \rangle$ .

Constraint: **lindb**  $\geq \mathbf{istb}[\mathbf{nb}] - 1$ .

On entry, **m** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint: if **method** = Nag\_SparseNsym\_RGMRES,  $1 \leq \mathbf{m} \leq \min(\mathbf{n}, \langle value \rangle)$ .

If **method** = Nag\_SparseNsym\_BiCGSTAB,  $1 \leq \mathbf{m} \leq \min(\mathbf{n}, \langle value \rangle)$ .

**NE\_INT\_ARRAY**

On entry, **indb**[ $\langle value \rangle$ ] =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint:  $1 \leq \mathbf{indb}[m-1] \leq \mathbf{n}$ , for  $m = \mathbf{istb}[0], \mathbf{istb}[0] + 1, \dots, \mathbf{istb}[\mathbf{nb}] - 1$ .

**NE\_INTERNAL\_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

**NE\_INVALID\_CS**

On entry, **icol**[ $\langle value \rangle$ ] =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint:  $1 \leq \mathbf{icol}[i-1] \leq \mathbf{n}$ , for  $i = 1, 2, \dots, \mathbf{nnz}$ .

Check that **a**, **irow**, **icol**, **ipivp**, **ipivq**, **istr** and **idiag** have not been corrupted between calls to nag\_sparse\_nsym\_precon\_bdilu (f11dfc) and nag\_sparse\_nsym\_precon\_bdilu\_solve (f11dgc).

On entry, **irow**[ $\langle value \rangle$ ] =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint:  $1 \leq \mathbf{irow}[i-1] \leq \mathbf{n}$ , for  $i = 1, 2, \dots, \mathbf{nnz}$ .

Check that **a**, **irow**, **icol**, **ipivp**, **ipivq**, **istr** and **idiag** have not been corrupted between calls to nag\_sparse\_nsym\_precon\_bdilu (f11dfc) and nag\_sparse\_nsym\_precon\_bdilu\_solve (f11dgc).

**NE\_INVALID\_CS\_PRECOND**

The CS representation of the preconditioner is invalid.

Check that **a**, **irow**, **icol**, **ipivp**, **ipivq**, **istr** and **idiag** have not been corrupted between calls to `nag_sparse_nsym_precon_bdilu` (f11dfc) and `nag_sparse_nsym_precon_bdilu_solve` (f11dgc).

**NE\_NO\_LICENCE**

Your licence key may have expired or may not have been installed correctly.

See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

**NE\_NOT\_STRICTLY\_INCREASING**

On entry, element  $\langle value \rangle$  of **a** was out of order.

Check that **a**, **irow**, **icol**, **ipivp**, **ipivq**, **istr** and **idiag** have not been corrupted between calls to `nag_sparse_nsym_precon_bdilu` (f11dfc) and `nag_sparse_nsym_precon_bdilu_solve` (f11dgc).

On entry, for  $b = \langle value \rangle$ ,  $\mathbf{istb}[b] = \langle value \rangle$  and  $\mathbf{istb}[b - 1] = \langle value \rangle$ .

Constraint:  $\mathbf{istb}[b] > \mathbf{istb}[b - 1]$ , for  $b = 1, 2, \dots, \mathbf{nb}$ .

On entry, location  $\langle value \rangle$  of (**irow**, **icol**) was a duplicate.

Check that **a**, **irow**, **icol**, **ipivp**, **ipivq**, **istr** and **idiag** have not been corrupted between calls to `nag_sparse_nsym_precon_bdilu` (f11dfc) and `nag_sparse_nsym_precon_bdilu_solve` (f11dgc).

**NE\_REAL**

On entry, **tol** =  $\langle value \rangle$ .

Constraint: **tol** < 1.0.

**7 Accuracy**

On successful termination, the final residual  $r_k = b - Ax_k$ , where  $k = \mathbf{itn}$ , satisfies the termination criterion

$$\|r_k\|_{\infty} \leq \tau \times (\|b\|_{\infty} + \|A\|_{\infty} \|x_k\|_{\infty}).$$

The value of the final residual norm is returned in **rnorm**.

**8 Parallelism and Performance**

`nag_sparse_nsym_precon_bdilu_solve` (f11dgc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

`nag_sparse_nsym_precon_bdilu_solve` (f11dgc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

**9 Further Comments**

The time taken by `nag_sparse_nsym_precon_bdilu_solve` (f11dgc) for each iteration is roughly proportional to the value of **nnzc** returned from the preceding call to `nag_sparse_nsym_precon_bdilu` (f11dfc).

The number of iterations required to achieve a prescribed accuracy cannot be easily determined *a priori*, as it can depend dramatically on the conditioning and spectrum of the preconditioned coefficient matrix  $\bar{A} = M^{-1}A$ .

Some illustrations of the application of nag\_sparse\_nsym\_precon\_bdilu\_solve (f1ldgc) to linear systems arising from the discretization of two-dimensional elliptic partial differential equations, and to random-valued randomly structured linear systems, can be found in Salvini and Shaw (1996).

## 10 Example

This example program reads in a sparse matrix  $A$  and a vector  $b$ . It calls nag\_sparse\_nsym\_precon\_bdilu (f1ldfc), with the array `lfill = 0` and the array `dtol = 0.0`, to compute an overlapping incomplete  $LU$  factorization. This is then used as an additive Schwarz preconditioner on a call to nag\_sparse\_nsym\_precon\_bdilu\_solve (f1ldgc) which uses the Bi-CGSTAB method to solve  $Ax = b$ .
