

# NAG Library Function Document

## nag\_quasi\_rand\_uniform (g05ymc)

### 1 Purpose

nag\_quasi\_rand\_uniform (g05ymc) generates a uniformly distributed low-discrepancy sequence as proposed by Sobol, Faure or Niederreiter. It must be preceded by a call to one of the initialization functions nag\_quasi\_init (g05ylc) or nag\_quasi\_init\_scrambled (g05ync).

### 2 Specification

```
#include <nag.h>
#include <nagg05.h>

void nag_quasi_rand_uniform (Nag_OrderType order, Integer n, double quas[],
    Integer pdquas, Integer iref[], NagError *fail)
```

### 3 Description

Low discrepancy (quasi-random) sequences are used in numerical integration, simulation and optimization. Like pseudorandom numbers they are uniformly distributed but they are not statistically independent, rather they are designed to give more even distribution in multidimensional space (uniformity). Therefore they are often more efficient than pseudorandom numbers in multidimensional Monte-Carlo methods.

nag\_quasi\_rand\_uniform (g05ymc) generates a set of points  $x^1, x^2, \dots, x^N$  with high uniformity in the  $S$ -dimensional unit cube  $I^S = [0, 1]^S$ .

Let  $G$  be a subset of  $I^S$  and define the counting function  $S_N(G)$  as the number of points  $x^i \in G$ . For each  $x = (x_1, x_2, \dots, x_S) \in I^S$ , let  $G_x$  be the rectangular  $S$ -dimensional region

$$G_x = [0, x_1) \times [0, x_2) \times \dots \times [0, x_S)$$

with volume  $x_1, x_2, \dots, x_S$ . Then one measure of the uniformity of the points  $x^1, x^2, \dots, x^N$  is the discrepancy:

$$D_N^*(x^1, x^2, \dots, x^N) = \sup_{x \in I^S} |S_N(G_x) - Nx_1, x_2, \dots, x_S|.$$

which has the form

$$D_N^*(x^1, x^2, \dots, x^N) \leq C_S(\log N)^S + O((\log N)^{S-1}) \quad \text{for all } N \geq 2.$$

The principal aim in the construction of low-discrepancy sequences is to find sequences of points in  $I^S$  with a bound of this form where the constant  $C_S$  is as small as possible.

The type of low-discrepancy sequence generated by nag\_quasi\_rand\_uniform (g05ymc) depends on the initialization function called and can include those proposed by Sobol, Faure or Niederreiter. If the initialization function nag\_quasi\_init\_scrambled (g05ync) was used then the sequence will be scrambled (see Section 3 in nag\_quasi\_init\_scrambled (g05ync) for details).

## 5 Arguments

**Note:** the following variables are used in the parameter descriptions:

$idim = \mathbf{idim}$ , the number of dimensions required, see `nag_quasi_init (g05ylc)` or `nag_quasi_init_scrambled (g05ync)`

$liref = \mathbf{liref}$ , the length of **iref** as supplied to the initialization function `nag_quasi_init (g05ylc)` or `nag_quasi_init_scrambled (g05ync)`

$tdquas = \mathbf{n}$  if **order** = Nag\_RowMajor; otherwise  $tdquas = idim$ .

- 1: **order** – Nag\_OrderType *Input*

*On entry:* the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag\_RowMajor. See Section 2.3.1.3 in How to Use the NAG Library and its Documentation for a more detailed explanation of the use of this argument.

*Constraint:* **order** = Nag\_RowMajor or Nag\_ColMajor.

- 2: **n** – Integer *Input*

*On entry:* the number of quasi-random numbers required.

*Constraint:*  $\mathbf{n} \geq 0$  and  $\mathbf{n} + \text{previous number of generated values} \leq 2^{31} - 1$ .

- 3: **quas**[ $\mathbf{pdquas} \times \mathbf{tdquas}$ ] – double *Output*

**Note:** the dimension,  $dim$ , of the array **quas** must be at least  $\mathbf{pdquas} \times \mathbf{tdquas}$ .

Where **QUAS**( $i, j$ ) appears in this document, it refers to the array element

$\mathbf{quas}[(j-1) \times \mathbf{pdquas} + i - 1]$  when **order** = Nag\_ColMajor;  
 $\mathbf{quas}[(i-1) \times \mathbf{pdquas} + j - 1]$  when **order** = Nag\_RowMajor.

*On exit:* **QUAS**( $i, j$ ) holds the  $i$ th value for the  $j$ th dimension.

- 4: **pdquas** – Integer *Input*

*On entry:* the stride separating row or column elements (depending on the value of **order**) in the array **quas**.

*Constraints:*

if **order** = Nag\_RowMajor,  $\mathbf{pdquas} \geq idim$ ;  
 if **order** = Nag\_ColMajor,  $\mathbf{pdquas} \geq \mathbf{n}$ .

- 5: **iref**[ $liref$ ] – Integer *Communication Array*

*On entry:* contains information on the current state of the sequence.

*On exit:* contains updated information on the state of the sequence.

- 6: **fail** – NagError \* *Input/Output*

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

**NE\_BAD\_PARAM**

On entry, argument  $\langle value \rangle$  had an illegal value.

**NE\_INITIALIZATION**

On entry, **iref** has either not been initialized or has been corrupted.

**NE\_INT**

On entry, **n** =  $\langle value \rangle$ .

Constraint: **n**  $\geq 0$ .

**NE\_INT\_2**

On entry, **pdquas** =  $\langle value \rangle$ , **idim** =  $\langle value \rangle$ .

Constraint: if **order** = Nag\_RowMajor, **pdquas**  $\geq idim$ .

On entry, **pdquas** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint: if **order** = Nag\_ColMajor, **pdquas**  $\geq n$ .

**NE\_INTERNAL\_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

**NE\_NO\_LICENCE**

Your licence key may have expired or may not have been installed correctly.

See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

**NE\_TOO\_MANY\_CALLS**

On entry, value of **n** would result in too many calls to the generator: **n** =  $\langle value \rangle$ , generator has previously been called  $\langle value \rangle$  times.

**7 Accuracy**

Not applicable.

**8 Parallelism and Performance**

nag\_quasi\_rand\_uniform (g05ymc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

The Sobol, Sobol (A659) and Niederreiter quasi-random number generators in nag\_quasi\_rand\_uniform (g05ymc) have been parallelized, but require quite large problem sizes to see any significant performance gain. Parallelism is only enabled when **order** = Nag\_ColMajor. The Faure generator is serial.

**9 Further Comments**

None.

## 10 Example

This example calls nag\_quasi\_init (g05ylc) and nag\_quasi\_rand\_uniform (g05ymc) to estimate the value of the integral

$$\int_0^1 \cdots \int_0^1 \prod_{i=1}^s |4x_i - 2| dx_1, dx_2, \dots, dx_s = 1.$$

In this example the number of dimensions  $S$  is set to 8.
