

NAG Library Function Document

nag_binary_factor_service (g11sbc)

1 Purpose

nag_binary_factor_service (g11sbc) is a service function which may be used prior to calling nag_binary_factor (g11sac) to calculate the frequency distribution of a set of dichotomous score patterns.

2 Specification

```
#include <nag.h>
#include <nagg11.h>

void nag_binary_factor_service (Nag_OrderType order, Integer p, Integer n,
    Integer *ns, Nag_Boolean x[], Integer pdx, Integer irl[],
    NagError *fail)
```

3 Description

When each of n individuals responds to each of p dichotomous variables the data assumes the form of the matrix X defined below

$$X = \begin{bmatrix} x_{11} & x_{12} & \dots & x_{1p} \\ x_{21} & x_{22} & \dots & x_{2p} \\ \vdots & \vdots & & \vdots \\ x_{n1} & x_{n2} & \dots & x_{np} \end{bmatrix} = \begin{bmatrix} \underline{x}_1 \\ \underline{x}_2 \\ \vdots \\ \underline{x}_n \end{bmatrix},$$

where the x take the value of 0 or 1 and $\underline{x}_l = (x_{l1}, x_{l2}, \dots, x_{lp})$, for $l = 1, 2, \dots, n$, denotes the score pattern of the l th individual. nag_binary_factor_service (g11sbc) calculates the number of different score patterns, s , and the frequency with which each occurs. This information can then be passed to nag_binary_factor (g11sac).

4 References

None.

5 Arguments

- 1: **order** – Nag_OrderType *Input*
On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 2.3.1.3 in How to Use the NAG Library and its Documentation for a more detailed explanation of the use of this argument.
Constraint: **order** = Nag_RowMajor or Nag_ColMajor.
- 2: **p** – Integer *Input*
On entry: p , the number of dichotomous variables.
Constraint: $p \geq 3$.

- 3: **n** – Integer *Input*
On entry: n , the number of individuals in the sample.
Constraint: $n \geq 7$.
- 4: **ns** – Integer * *Output*
On exit: the number of different score patterns, s .
- 5: **x**[*dim*] – Nag_Boolean *Input/Output*
Note: the dimension, *dim*, of the array **x** must be at least
 $\max(1, \mathbf{pdx} \times \mathbf{p})$ when **order** = Nag_ColMajor;
 $\max(1, \mathbf{n} \times \mathbf{pdx})$ when **order** = Nag_RowMajor.
Where **X**(i, j) appears in this document, it refers to the array element
 $\mathbf{x}[(j-1) \times \mathbf{pdx} + i - 1]$ when **order** = Nag_ColMajor;
 $\mathbf{x}[(i-1) \times \mathbf{pdx} + j - 1]$ when **order** = Nag_RowMajor.
On entry: **X**(i, j) must be set equal to Nag_TRUE if $x_{ij} = 1$, and Nag_FALSE if $x_{ij} = 0$, for $i = 1, 2, \dots, n$ and $j = 1, 2, \dots, p$.
On exit: the first s rows of **x** contain the s different score patterns.
- 6: **pdx** – Integer *Input*
On entry: the stride separating row or column elements (depending on the value of **order**) in the array **x**.
Constraints:
if **order** = Nag_ColMajor, $\mathbf{pdx} \geq \mathbf{n}$;
if **order** = Nag_RowMajor, $\mathbf{pdx} \geq \mathbf{p}$.
- 7: **irl**[\mathbf{n}] – Integer *Output*
On exit: the frequency with which the l th row of **x** occurs, for $l = 1, 2, \dots, s$.
- 8: **fail** – NagError * *Input/Output*
The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

NE_BAD_PARAM

On entry, argument $\langle \text{value} \rangle$ had an illegal value.

NE_INT

On entry, **n** = $\langle \text{value} \rangle$.

Constraint: $\mathbf{n} \geq 7$.

On entry, **p** = $\langle \text{value} \rangle$.

Constraint: $\mathbf{p} \geq 3$.

On entry, **pdx** = $\langle value \rangle$.
 Constraint: **pdx** > 0.

NE_INT_2

On entry, **pdx** = $\langle value \rangle$ and **n** = $\langle value \rangle$.
 Constraint: **pdx** ≥ **n**.

On entry, **pdx** = $\langle value \rangle$ and **p** = $\langle value \rangle$.
 Constraint: **pdx** ≥ **p**.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
 See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.
 See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

7 Accuracy

Exact.

8 Parallelism and Performance

nag_binary_factor_service (g11sbc) is not threaded in any implementation.

9 Further Comments

The time taken by nag_binary_factor_service (g11sbc) is small and increases with n .

10 Example

This example counts the frequencies of different score patterns in the following list:

Score Patterns
 000
 010
 111
 000
 001
 000
 000
 110
 001
 011
