

NAG Library Function Document

nag_reorder_vector (m01esc)

1 Purpose

nag_reorder_vector (m01esc) rearranges a vector of arbitrary type data objects into the order specified by a vector of indices.

2 Specification

```
#include <nag.h>
#include <nagm01.h>

void nag_reorder_vector (Pointer vec, size_t n, size_t size,
    ptrdiff_t stride, size_t indices[], NagError *fail)
```

3 Description

nag_reorder_vector (m01esc) uses a variant of list merging as described by Knuth (1973). The function rearranges a set of n data objects of arbitrary type, which are stored in an array at intervals of length **stride**, into the order specified by an array of indices.

4 References

5 Arguments

- 1: **vec[n]** – Pointer *Input/Output*
On entry: the array of objects to be rearranged.
On exit: the objects rearranged according to array **indices**.
- 2: **n** – size_t *Input*
On entry: the number, n , of objects to be rearranged.
Constraint: $0 \leq n \leq \text{MAX_LENGTH}$, where MAX_LENGTH is an implementation-dependent value for the maximum size of an array.
- 3: **size** – size_t *Input*
On entry: the size of each object to be rearranged.
Constraint: $1 \leq \text{size} \leq p$, where p is an implementation-dependent value for the maximum size_t size on the system, divided by **n** if **n** is positive.
- 4: **stride** – ptrdiff_t *Input*
On entry: the increment between data items in **vec** to be rearranged.
Note: if **stride** is positive, **vec** should point at the first data object; otherwise **vec** should point at the last data object.
Constraint: $\text{size} \leq |\text{stride}| \leq p$, where p is an implementation-dependent value for the maximum size_t size on the system, divided by **n** if **n** is positive.

- 5: **indices**[**n**] – size_t *Input*
On entry: the indices specifying the order in which the elements of vector are to be rearranged.
- 6: **fail** – NagError * *Input/Output*
 The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

6 Error Indicators and Warnings

NE_2_INT_ARG_LT

On entry, $|\mathbf{stride}| = \langle value \rangle$ while $\mathbf{size} = \langle value \rangle$. These arguments must satisfy $|\mathbf{stride}| \geq \mathbf{size}$.

NE_ALLOC_FAIL

Dynamic memory allocation failed.

NE_BAD_RANK

Invalid **indices** vector.

NE_INT_ARG_GT

On entry, $\mathbf{n} = \langle value \rangle$.

Constraint: $\mathbf{n} \leq \langle value \rangle$, an implementation-dependent size that is printed in the error message.

On entry, $\mathbf{size} = \langle value \rangle$.

Constraint: $\mathbf{size} \leq \langle value \rangle$, an implementation-dependent size that is printed in the error message.

On entry, $\mathbf{stride} = \langle value \rangle$.

Constraint: $|\mathbf{stride}| \leq \langle value \rangle$, an implementation-dependent size that is printed in the error message.

NE_INT_ARG_LT

On entry, $\mathbf{n} = \langle value \rangle$.

Constraint: $\mathbf{n} \geq 0$.

On entry, $\mathbf{size} = \langle value \rangle$.

Constraint: $\mathbf{size} \geq 1$.

7 Accuracy

Not applicable.

8 Parallelism and Performance

nag_reorder_vector (m01esc) is not threaded in any implementation.

9 Further Comments

The average time taken by the function is approximately proportional to **n**.

10 Example

The example program.
