## nag\_real\_polygamma (s14aec)

### 1 Purpose

nag\_real\_polygamma (s14aec) returns the value of the  $k$ th derivative of the psi function  $\psi(x)$  for real  $x$  and  $k = 0, 1, \dots, 6$ .

### 2 Specification

```
#include <nag.h>
#include <nags.h>

double nag_real_polygamma (double x, Integer k, NagError *fail)
```

### 3 Description

nag\_real\_polygamma (s14aec) evaluates an approximation to the  $k$ th derivative of the psi function  $\psi(x)$  given by

$$\psi^{(k)}(x) = \frac{d^k}{dx^k} \psi(x) = \frac{d^k}{dx^k} \left( \frac{d}{dx} \log_e \Gamma(x) \right),$$

where  $x$  is real with  $x \neq 0, -1, -2, \dots$  and  $k = 0, 1, \dots, 6$ . For negative noninteger values of  $x$ , the recurrence relationship

$$\psi^{(k)}(x+1) = \psi^{(k)}(x) + \frac{d^k}{dx^k} \left( \frac{1}{x} \right)$$

is used. The value of  $\frac{(-1)^{k+1} \psi^{(k)}(x)}{k!}$  is obtained by a call to nag\_polygamma\_deriv (s14adc), which is based on the function PSIFN in Amos (1983).

Note that  $\psi^{(k)}(x)$  is also known as the *polygamma* function. Specifically,  $\psi^{(0)}(x)$  is often referred to as the *digamma* function and  $\psi^{(1)}(x)$  as the *trigamma* function in the literature. Further details can be found in Abramowitz and Stegun (1972).

### 5 Arguments

- 1: **x** – double *Input*  
*On entry:* the argument  $x$  of the function.  
*Constraint:*  $x$  must not be ‘too close’ (see Section 6) to a non-positive integer.
- 2: **k** – Integer *Input*  
*On entry:* the function  $\psi^{(k)}(x)$  to be evaluated.  
*Constraint:*  $0 \leq k \leq 6$ .

- 3: **fail** – NagError \* *Input/Output*  
 The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.  
 See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

### NE\_INT

On entry,  $k = \langle value \rangle$ .  
 Constraint:  $k \leq 6$ .  
 On entry,  $k = \langle value \rangle$ .  
 Constraint:  $k \geq 0$ .

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.  
 See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

### NE\_NO\_LICENCE

Your licence key may have expired or may not have been installed correctly.  
 See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

### NE\_OVERFLOW\_LIKELY

Evaluation abandoned due to likelihood of overflow.

### NE\_REAL

On entry,  $x$  is ‘too close’ to a non-positive integer:  $x = \langle value \rangle$  and  $\text{nint}(x) = \langle value \rangle$ .

### NE\_UNDERFLOW\_LIKELY

Evaluation abandoned due to likelihood of underflow.

## 7 Accuracy

All constants in nag\_polygamma\_deriv (s14adc) are given to approximately 18 digits of precision. If  $t$  denotes the number of digits of precision in the floating-point arithmetic being used, then clearly the maximum number in the results obtained is limited by  $p = \min(t, 18)$ . Empirical tests by Amos (1983) have shown that the maximum relative error is a loss of approximately two decimal places of precision. Further tests with the function  $-\psi^{(0)}(x)$  have shown somewhat improved accuracy, except at points near the positive zero of  $\psi^{(0)}(x)$  at  $x = 1.46\dots$ , where only absolute accuracy can be obtained.

## 8 Parallelism and Performance

nag\_real\_polygamma (s14aec) is not threaded in any implementation.

## 9 Further Comments

None.

## 10 Example

This example evaluates  $\psi^{(2)}(x)$  at  $x = 2.5$ , and prints the results.
