

NAG Library Routine Document

F08SPF (ZHEGVX)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

1 Purpose

F08SPF (ZHEGVX) computes selected eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian-definite eigenproblem, of the form

$$Az = \lambda Bz, \quad ABz = \lambda z \quad \text{or} \quad BAz = \lambda z,$$

where A and B are Hermitian and B is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

2 Specification

```
SUBROUTINE F08SPF (ITYPE, JOBZ, RANGE, UPLO, N, A, LDA, B, LDB, VL, VU,      &
                  IL, IU, ABSTOL, M, W, Z, LDZ, WORK, LWORK, RWORK,      &
                  IWORK, JFAIL, INFO)
INTEGER            ITYPE, N, LDA, LDB, IL, IU, M, LDZ, LWORK,          &
                  IWORK(5*N), JFAIL(*), INFO
REAL (KIND=nag_wp) VL, VU, ABSTOL, W(N), RWORK(7*N)
COMPLEX (KIND=nag_wp) A(LDA,*), B(LDB,*), Z(LDZ,*), WORK(max(1,LWORK))
CHARACTER(1)      JOBZ, RANGE, UPLO
```

The routine may be called by its LAPACK name ***zhegvx***.

3 Description

F08SPF (ZHEGVX) first performs a Cholesky factorization of the matrix B as $B = U^H U$, when $UPLO = 'U'$ or $B = LL^H$, when $UPLO = 'L'$. The generalized problem is then reduced to a standard symmetric eigenvalue problem

$$Cx = \lambda x,$$

which is solved for the desired eigenvalues and eigenvectors; the eigenvectors are then backtransformed to give the eigenvectors of the original problem.

For the problem $Az = \lambda Bz$, the eigenvectors are normalized so that the matrix of eigenvectors, Z , satisfies

$$Z^H A Z = \Lambda \quad \text{and} \quad Z^H B Z = I,$$

where Λ is the diagonal matrix whose diagonal elements are the eigenvalues. For the problem $ABz = \lambda z$ we correspondingly have

$$Z^{-1} A Z^{-H} = \Lambda \quad \text{and} \quad Z^H B Z = I,$$

and for $BAz = \lambda z$ we have

$$Z^H A Z = \Lambda \quad \text{and} \quad Z^H B^{-1} Z = I.$$

5 Arguments

- 1: ITYPE – INTEGER *Input*
On entry: specifies the problem type to be solved.
 ITYPE = 1
 $Az = \lambda Bz$.
 ITYPE = 2
 $ABz = \lambda z$.
 ITYPE = 3
 $BAz = \lambda z$.
Constraint: ITYPE = 1, 2 or 3.
- 2: JOBZ – CHARACTER(1) *Input*
On entry: indicates whether eigenvectors are computed.
 JOBZ = 'N'
 Only eigenvalues are computed.
 JOBZ = 'V'
 Eigenvalues and eigenvectors are computed.
Constraint: JOBZ = 'N' or 'V'.
- 3: RANGE – CHARACTER(1) *Input*
On entry: if RANGE = 'A', all eigenvalues will be found.
 If RANGE = 'V', all eigenvalues in the half-open interval (VL, VU] will be found.
 If RANGE = 'I', the ILth to IUth eigenvalues will be found.
Constraint: RANGE = 'A', 'V' or 'I'.
- 4: UPLO – CHARACTER(1) *Input*
On entry: if UPLO = 'U', the upper triangles of A and B are stored.
 If UPLO = 'L', the lower triangles of A and B are stored.
Constraint: UPLO = 'U' or 'L'.
- 5: N – INTEGER *Input*
On entry: n , the order of the matrices A and B .
Constraint: $N \geq 0$.

- 6: A(LDA,*) – COMPLEX (KIND=nag_wp) array Input/Output
Note: the second dimension of the array A must be at least $\max(1, N)$.
On entry: the n by n Hermitian matrix A .
 If UPLO = 'U', the upper triangular part of A must be stored and the elements of the array below the diagonal are not referenced.
 If UPLO = 'L', the lower triangular part of A must be stored and the elements of the array above the diagonal are not referenced.
On exit: the lower triangle (if UPLO = 'L') or the upper triangle (if UPLO = 'U') of A , including the diagonal, is overwritten.
- 7: LDA – INTEGER Input
On entry: the first dimension of the array A as declared in the (sub)program from which F08SPF (ZHEGVX) is called.
Constraint: $LDA \geq \max(1, N)$.
- 8: B(LDB,*) – COMPLEX (KIND=nag_wp) array Input/Output
Note: the second dimension of the array B must be at least $\max(1, N)$.
On entry: the n by n Hermitian matrix B .
 If UPLO = 'U', the upper triangular part of B must be stored and the elements of the array below the diagonal are not referenced.
 If UPLO = 'L', the lower triangular part of B must be stored and the elements of the array above the diagonal are not referenced.
On exit: the triangular factor U or L from the Cholesky factorization $B = U^H U$ or $B = L L^H$.
- 9: LDB – INTEGER Input
On entry: the first dimension of the array B as declared in the (sub)program from which F08SPF (ZHEGVX) is called.
Constraint: $LDB \geq \max(1, N)$.
- 10: VL – REAL (KIND=nag_wp) Input
 11: VU – REAL (KIND=nag_wp) Input
On entry: if RANGE = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.
 If RANGE = 'A' or 'I', VL and VU are not referenced.
Constraint: if RANGE = 'V', $VL < VU$.
- 12: IL – INTEGER Input
 13: IU – INTEGER Input
On entry: if RANGE = 'I', the indices (in ascending order) of the smallest and largest eigenvalues to be returned.
 If RANGE = 'A' or 'V', IL and IU are not referenced.
Constraints:
 if RANGE = 'I' and $N = 0$, $IL = 1$ and $IU = 0$;
 if RANGE = 'I' and $N > 0$, $1 \leq IL \leq IU \leq N$.

- 14: ABSTOL – REAL (KIND=nag_wp) *Input*
On entry: the absolute error tolerance for the eigenvalues. An approximate eigenvalue is accepted as converged when it is determined to lie in an interval $[a, b]$ of width less than or equal to
$$\text{ABSTOL} + \epsilon \max(|a|, |b|),$$
where ϵ is the **machine precision**. If ABSTOL is less than or equal to zero, then $\epsilon \|T\|_1$ will be used in its place, where T is the tridiagonal matrix obtained by reducing C to tridiagonal form. Eigenvalues will be computed most accurately when ABSTOL is set to twice the underflow threshold $2 \times \text{X02AMF}()$, not zero. If this routine returns with INFO = 1 to N, indicating that some eigenvectors did not converge, try setting ABSTOL to $2 \times \text{X02AMF}()$. See Demmel and Kahan (1990).
- 15: M – INTEGER *Output*
On exit: the total number of eigenvalues found. $0 \leq M \leq N$.
If RANGE = 'A', $M = N$.
If RANGE = 'T', $M = \text{IU} - \text{IL} + 1$.
- 16: W(N) – REAL (KIND=nag_wp) array *Output*
On exit: the first M elements contain the selected eigenvalues in ascending order.
- 17: Z(LDZ,*) – COMPLEX (KIND=nag_wp) array *Output*
Note: the second dimension of the array Z must be at least $\max(1, M)$ if JOBZ = 'V', and at least 1 otherwise.
On exit: if JOBZ = 'V', then
if INFO = 0, the first M columns of Z contain the orthonormal eigenvectors of the matrix A corresponding to the selected eigenvalues, with the i th column of Z holding the eigenvector associated with $W(i)$. The eigenvectors are normalized as follows:
if ITYPE = 1 or 2, $Z^H B Z = I$;
if ITYPE = 3, $Z^H B^{-1} Z = I$;
if an eigenvector fails to converge (INFO = 1 to N), then that column of Z contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in JFAIL.
If JOBZ = 'N', Z is not referenced.
Note: you must ensure that at least $\max(1, M)$ columns are supplied in the array Z; if RANGE = 'V', the exact value of M is not known in advance and an upper bound of at least N must be used.
- 18: LDZ – INTEGER *Input*
On entry: the first dimension of the array Z as declared in the (sub)program from which F08SPF (ZHEGVX) is called.
Constraints:
if JOBZ = 'V', $\text{LDZ} \geq \max(1, N)$;
otherwise $\text{LDZ} \geq 1$.
- 19: WORK(max(1, LWORK)) – COMPLEX (KIND=nag_wp) array *Workspace*
On exit: if INFO = 0, the real part of WORK(1) contains the minimum value of LWORK required for optimal performance.

- 20: LWORK – INTEGER *Input*
On entry: the dimension of the array WORK as declared in the (sub)program from which F08SPF (ZHEGVX) is called.
 If LWORK = -1, a workspace query is assumed; the routine only calculates the optimal size of the WORK array, returns this value as the first entry of the WORK array, and no error message related to LWORK is issued.
Suggested value: for optimal performance, $LWORK \geq (nb + 1) \times N$, where *nb* is the optimal **block size** for F08FSF (ZHETRD).
Constraint: $LWORK \geq \max(1, 2 \times N)$.
- 21: RWORK(7 × N) – REAL (KIND=nag_wp) array *Workspace*
- 22: IWORK(5 × N) – INTEGER array *Workspace*
- 23: JFAIL(*) – INTEGER array *Output*
Note: the dimension of the array JFAIL must be at least max(1, N).
On exit: if JOBZ = 'V', then
 if INFO = 0, the first M elements of JFAIL are zero;
 if INFO = 1 to N, JFAIL contains the indices of the eigenvectors that failed to converge.
 If JOBZ = 'N', JFAIL is not referenced.
- 24: INFO – INTEGER *Output*
On exit: INFO = 0 unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

INFO < 0

If INFO = -*i*, argument *i* had an illegal value. An explanatory message is output, and execution of the program is terminated.

INFO = 1 to N

If INFO = *i*, F08FPF (ZHEEVX) failed to converge; *i* eigenvectors failed to converge. Their indices are stored in array JFAIL.

INFO > N

F07FRF (ZPOTRF) returned an error code; i.e., if INFO = N + *i*, for $1 \leq i \leq N$, then the leading minor of order *i* of *B* is not positive definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

7 Accuracy

If *B* is ill-conditioned with respect to inversion, then the error bounds for the computed eigenvalues and vectors may be large, although when the diagonal elements of *B* differ widely in magnitude the eigenvalues and eigenvectors may be less sensitive than the condition of *B* would suggest. See Section 4.10 of Anderson *et al.* (1999) for details of the error bounds.

8 Parallelism and Performance

F08SPF (ZHEGVX) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

F08SPF (ZHEGVX) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this routine. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of floating-point operations is proportional to n^3 .

The real analogue of this routine is F08SBF (DSYGVX).

10 Example

This example finds the eigenvalues in the half-open interval $(-3, 3]$, and corresponding eigenvectors, of the generalized Hermitian eigenproblem $Az = \lambda Bz$, where

$$A = \begin{pmatrix} -7.36 & 0.77 - 0.43i & -0.64 - 0.92i & 3.01 - 6.97i \\ 0.77 + 0.43i & 3.49 & 2.19 + 4.45i & 1.90 + 3.73i \\ -0.64 + 0.92i & 2.19 - 4.45i & 0.12 & 2.88 - 3.17i \\ 3.01 + 6.97i & 1.90 - 3.73i & 2.88 + 3.17i & -2.54 \end{pmatrix}$$

and

$$B = \begin{pmatrix} 3.23 & 1.51 - 1.92i & 1.90 + 0.84i & 0.42 + 2.50i \\ 1.51 + 1.92i & 3.58 & -0.23 + 1.11i & -1.18 + 1.37i \\ 1.90 - 0.84i & -0.23 - 1.11i & 4.09 & 2.33 - 0.14i \\ 0.42 - 2.50i & -1.18 - 1.37i & 2.33 + 0.14i & 4.29 \end{pmatrix}.$$

The example program for F08SQF (ZHEGVD) illustrates solving a generalized Hermitian eigenproblem of the form $ABz = \lambda z$.
