

# NAG Library Routine Document

## S14CBF

**Note:** before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

### 1 Purpose

S14CBF returns the value of the logarithm of the beta function,  $\ln B(a, b)$ , via the routine name.

### 2 Specification

```
FUNCTION S14CBF (A, B, IFAIL)
  REAL (KIND=nag_wp) S14CBF
  INTEGER IFAIL
  REAL (KIND=nag_wp) A, B
```

### 3 Description

S14CBF calculates values for  $\ln B(a, b)$  where  $B$  is the beta function given by

$$B(a, b) = \int_0^1 t^{a-1} (1-t)^{b-1} dt$$

or equivalently

$$B(a, b) = \frac{\Gamma(a)\Gamma(b)}{\Gamma(a+b)}$$

and  $\Gamma(x)$  is the gamma function. Note that the beta function is symmetric, so that  $B(a, b) = B(b, a)$ .

In order to efficiently obtain accurate results several methods are used depending on the parameters  $a$  and  $b$ .

Let  $a_0 = \min(a, b)$  and  $b_0 = \max(a, b)$ . Then:

for  $a_0 \geq 8$ ,

$$\ln B = 0.5 \ln(2\pi) - 0.5 \ln(b_0) + \Delta(a_0) + \Delta(b_0) - \Delta(a_0 + b_0) - u - v;$$

where

$$\Delta(a_0) = \ln \Gamma(a_0) - (a_0 - 0.5) \ln a_0 + a_0 - 0.5 \ln(2\pi),$$

$$u = -(a_0 - 0.5) \ln \left[ \frac{a_0}{a_0 + b_0} \right] \quad \text{and}$$

$$v = b_0 \ln \left( 1 + \frac{a_0}{b_0} \right).$$

for  $a_0 < 1$ ,

for  $b_0 \geq 8$ ,

$$\ln B = \ln \Gamma(a_0) + \ln \frac{\Gamma(b_0)}{\Gamma(a_0 + b_0)};$$

for  $b_0 < 8$ ,

$$\ln B = \ln \Gamma(a_0) + \ln \Gamma(b_0) - \ln \Gamma(a_0 + b_0);$$

for  $2 < a_0 < 8$ ,  $a_0$  is reduced to the interval  $[1, 2]$  by  $B(a, b) = \frac{a_0-1}{a_0+b_0-1} B(a_0-1, b_0)$ ;

for  $1 \leq a_0 \leq 2$ ,

for  $b_0 \geq 8$ ,

$$\ln B = \ln \Gamma(a_0) + \ln \frac{\Gamma(b_0)}{\Gamma(a_0 + b_0)};$$

for  $2 < b_0 < 8$ ,  $b_0$  is reduced to the interval  $[1, 2]$ ;

for  $b_0 \leq 2$ ,

$$\ln B = \ln \Gamma(a_0) + \ln \Gamma(b_0) - \ln \Gamma(a_0 + b_0).$$

S14CBF is derived from BETALN in DiDonato and Morris (1992).

## 5 Arguments

- 1: A – REAL (KIND=nag\_wp) *Input*  
*On entry:* the argument  $a$  of the function.  
*Constraint:*  $A > 0.0$ .
- 2: B – REAL (KIND=nag\_wp) *Input*  
*On entry:* the argument  $b$  of the function.  
*Constraint:*  $B > 0.0$ .
- 3: IFAIL – INTEGER *Input/Output*  
*On entry:* IFAIL must be set to 0,  $-1$  or 1. If you are unfamiliar with this argument you should refer to Section 3.4 in How to Use the NAG Library and its Documentation for details.  
For environments where it might be inappropriate to halt program execution when an error is detected, the value  $-1$  or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this argument, the recommended value is 0. **When the value  $-1$  or 1 is used it is essential to test the value of IFAIL on exit.**  
*On exit:* IFAIL = 0 unless the routine detects an error or a warning has been flagged (see Section 6).

## 6 Error Indicators and Warnings

If on entry IFAIL = 0 or  $-1$ , explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

On entry,  $A = \langle value \rangle$ .  
*Constraint:*  $A > 0.0$ .

On entry,  $B = \langle value \rangle$ .  
*Constraint:*  $B > 0.0$ .

IFAIL = -99

An unexpected error has been triggered by this routine. Please contact NAG.

See Section 3.9 in How to Use the NAG Library and its Documentation for further information.

IFAIL = -399

Your licence key may have expired or may not have been installed correctly.

See Section 3.8 in How to Use the NAG Library and its Documentation for further information.

IFAIL = -999

Dynamic memory allocation failed.

See Section 3.7 in How to Use the NAG Library and its Documentation for further information.

## 7 Accuracy

S14CBF should produce full relative accuracy for all input arguments.

## 8 Parallelism and Performance

S14CBF is not threaded in any implementation.

## 9 Further Comments

None.

## 10 Example

This example reads values of the arguments  $a$  and  $b$  from a file, evaluates the function and prints the results.
