

# NAG Library Routine Document

## S18ATF

**Note:** before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

### 1 Purpose

S18ATF returns an array of values for the modified Bessel function  $I_1(x)$ .

### 2 Specification

```
SUBROUTINE S18ATF (N, X, F, IVALID, IFAIL)
  INTEGER          N, IVALID(N), IFAIL
  REAL (KIND=nag_wp) X(N), F(N)
```

### 3 Description

S18ATF evaluates an approximation to the modified Bessel function of the first kind  $I_1(x_i)$  for an array of arguments  $x_i$ , for  $i = 1, 2, \dots, n$ .

**Note:**  $I_1(-x) = -I_1(x)$ , so the approximation need only consider  $x \geq 0$ .

The routine is based on three Chebyshev expansions:

For  $0 < x \leq 4$ ,

$$I_1(x) = x \sum_{r=0} a_r T_r(t), \quad \text{where } t = 2\left(\frac{x}{4}\right)^2 - 1;$$

For  $4 < x \leq 12$ ,

$$I_1(x) = e^x \sum_{r=0} b_r T_r(t), \quad \text{where } t = \frac{x-8}{4};$$

For  $x > 12$ ,

$$I_1(x) = \frac{e^x}{\sqrt{x}} \sum_{r=0} c_r T_r(t), \quad \text{where } t = 2\left(\frac{12}{x}\right) - 1.$$

For small  $x$ ,  $I_1(x) \simeq x$ . This approximation is used when  $x$  is sufficiently small for the result to be correct to ***machine precision***.

For large  $x$ , the routine must fail because  $I_1(x)$  cannot be represented without overflow.

### 5 Arguments

1: N – INTEGER

*Input*

*On entry:*  $n$ , the number of points.

*Constraint:*  $N \geq 0$ .

- 2:  $X(N)$  – REAL (KIND=nag\_wp) array *Input*  
*On entry:* the argument  $x_i$  of the function, for  $i = 1, 2, \dots, N$ .
- 3:  $F(N)$  – REAL (KIND=nag\_wp) array *Output*  
*On exit:*  $I_1(x_i)$ , the function values.
- 4:  $IVALID(N)$  – INTEGER array *Output*  
*On exit:*  $IVALID(i)$  contains the error code for  $x_i$ , for  $i = 1, 2, \dots, N$ .  
 $IVALID(i) = 0$   
 No error.  
 $IVALID(i) = 1$   
 $x_i$  is too large.  $F(i)$  contains the approximate value of  $I_1(x_i)$  at the nearest valid argument.  
 The threshold value is the same as for  $IFAIL = 1$  in S18AFF, as defined in the Users' Note for your implementation.
- 5:  $IFAIL$  – INTEGER *Input/Output*  
*On entry:*  $IFAIL$  must be set to 0, -1 or 1. If you are unfamiliar with this argument you should refer to Section 3.4 in How to Use the NAG Library and its Documentation for details.  
 For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this argument, the recommended value is 0. **When the value -1 or 1 is used it is essential to test the value of  $IFAIL$  on exit.**  
*On exit:*  $IFAIL = 0$  unless the routine detects an error or a warning has been flagged (see Section 6).

## 6 Error Indicators and Warnings

If on entry  $IFAIL = 0$  or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

$IFAIL = 1$

On entry, at least one value of  $X$  was invalid.  
 Check  $IVALID$  for more information.

$IFAIL = 2$

On entry,  $N = \langle value \rangle$ .  
 Constraint:  $N \geq 0$ .

$IFAIL = -99$

An unexpected error has been triggered by this routine. Please contact NAG.  
 See Section 3.9 in How to Use the NAG Library and its Documentation for further information.

$IFAIL = -399$

Your licence key may have expired or may not have been installed correctly.  
 See Section 3.8 in How to Use the NAG Library and its Documentation for further information.

IFAIL = -999

Dynamic memory allocation failed.

See Section 3.7 in How to Use the NAG Library and its Documentation for further information.

## 7 Accuracy

Let  $\delta$  and  $\epsilon$  be the relative errors in the argument and result respectively.

If  $\delta$  is somewhat larger than the *machine precision* (i.e., if  $\delta$  is due to data errors etc.), then  $\epsilon$  and  $\delta$  are approximately related by:

$$\epsilon \simeq \left| \frac{xI_0(x) - I_1(x)}{I_1(x)} \right| \delta.$$

Figure 1 shows the behaviour of the error amplification factor

$$\left| \frac{xI_0(x) - I_1(x)}{I_1(x)} \right|.$$

Figure 1

However, if  $\delta$  is of the same order as *machine precision*, then rounding errors could make  $\epsilon$  slightly larger than the above relation predicts.

For small  $x$ ,  $\epsilon \simeq \delta$  and there is no amplification of errors.

For large  $x$ ,  $\epsilon \simeq x\delta$  and we have strong amplification of errors. However, for quite moderate values of  $x$  ( $x > \hat{x}$ , the threshold value), the routine must fail because  $I_1(x)$  would overflow; hence in practice the loss of accuracy for  $x$  close to  $\hat{x}$  is not excessive and the errors will be dominated by those of the standard function exp.

## 8 Parallelism and Performance

S18ATF is not threaded in any implementation.

## 9 Further Comments

None.

## 10 Example

This example reads values of  $X$  from a file, evaluates the function at each value of  $x_i$  and prints the results.
